

Winthrop Quadrangle, Maine

Compiled by
Craig D. Neil and Thomas K. Weddle
 Preliminary aquifer boundaries mapped by:
Daniel B. Locke

Digital cartography by:
Michael E. Foley
Susan S. Tolman

Robert G. Marvinney
State Geologist

Cartographic design and editing by:
Robert D. Tucker
Bennett J. Wilson, Jr.

Funding for the preparation of this map was provided in part by the
 Maine Department of Environmental Protection.

Maine Geological Survey

Open-File No. 04-78

2004

This map supersedes
 Open-File Map 99-32.

Significant Sand and Gravel Aquifers

Aquifer boundaries modified in 2004 based on 2003 field work by W. B. Thompson. Aquifer boundaries modified from: Tolman, A. L., and Lancot, E. M. (compilers), 1985. Hydrogeologic data for significant sand and gravel aquifers in parts of Kennebec, Lincoln, and Sagadahoc Counties, Maine. Map 17. Maine Geological Survey, Open-File Map 85-82e, scale 1:50,000.

Well inventory data from U.S. Geological Survey Basic-Data Reports and additional data collected by Maine Geological Survey field assistants during the 1982 field season.

Drainage basin boundaries compiled by U.S. Geological Survey, Water Resources Division, Augusta, Maine, with funding from the Maine Low-Level Radioactive Waste Authority.

Quadrangle Location

SCALE 1 : 24,000
 CONTOUR INTERVAL 10 FEET

Topographic base from U.S. Geological Survey Winthrop quadrangle, scale 1:24,000 using standard U.S. Geological Survey topographic map symbols.
 The use of industry, firm, or local government names on this map is for location purposes only and does not implicate responsibility for any present or potential effects on the natural resources.

SIGNIFICANT SAND AND GRAVEL AQUIFERS (yields greater than 10 gallons per minute)

- Approximate boundary of surficial deposits with significant saturated thickness where potential ground-water yield is moderate to excellent.
- Orange box: Surficial deposits with good to excellent potential ground-water yield; yields generally greater than 50 gallons per minute to a properly constructed well. Deposits consist primarily of glacial sand and gravel, but can include areas of sandy till and alluvium; yield zones are based on subsurface data where available, and may vary from mapped extent in areas where data are unavailable.
- Yellow box: Surficial deposits with moderate to good potential ground-water yield; yields generally greater than 10 gallons per minute to a properly constructed well. Deposits consist primarily of glacial sand and gravel, but can include areas of sandy till and alluvium; yields may exceed 50 gallons per minute in deposits hydraulically connected with surface-water bodies, or in extensive deposits where subsurface data are available.

SURFICIAL DEPOSITS WITH LESS FAVORABLE AQUIFER CHARACTERISTICS (yields less than 10 gallons per minute)

- White box: Areas with moderate to low or no potential ground-water yield (includes areas underlain by till, marine deposits, eolian deposits, alluvium, swamps, thin glacial sand and gravel deposits, or bedrock); yields in surficial deposits generally less than 10 gallons per minute to a properly constructed well.

SEISMIC-LINE INFORMATION

Profiles for 12-channel seismic lines are shown in Figure 10 of Open-File Report 85-82a (Tepper and others, 1985), or may be viewed at the Maine Geological Survey. Length of 12-channel seismic lines as shown on the map is to scale. All single-channel lines ranged from 80 to 300 feet long and are not shown to scale.

- 53 Depth to bedrock, in feet below land surface.
- ≥53 Depth to bedrock exceeds depth shown (based on calculations).
- 12 W Depth to water level, in feet below land surface.
- MAP-7 131, 23 Twelve-channel seismic line, with depth to bedrock and depth to water shown at the midpoint of the line, in feet below land surface.
- 69, 12 Single-channel seismic line, with depth to bedrock and depth to water shown at each end of the line, in feet below land surface.
- MAP-E 72, 12 Single-channel seismic line, with depth to bedrock and depth to water shown at each end of the line, in feet below land surface. Unless otherwise indicated, data shown above the line-identifier box refers to the northern end of the seismic line.

The 3-letter identifier for a line is an abbreviation for the topographic quadrangle. If the 3-letter identifier for the line is followed by a number (ex. MAP - 7, MAP - 4), the line is a 12-channel line. If the identifier is followed by a letter (ex. MAP - E, MAP - P), the line is a single-channel line. Single-channel seismic interpretations by D. H. Tepper. Twelve-channel seismic interpretations by D. H. Tepper and C. D. Neil.

GEOLOGIC AND WELL INFORMATION

- 50 Depth to bedrock, in feet below land surface
- ≥13 Penetration depth of boring; ≥ symbol refers to minimum depth to bedrock based on boring depth or refusal
- 6 W Depth to water level in feet below land surface (observed in well, spring, test boring, pit, or seismic line)
- X Gravel pit (overburden thickness in feet, e.g. 5-12')
- Q Quarry
- 4 GPM Yield (flow) of well or spring in gallons per minute (GPM)
- Spring with general direction of flow
- Drilled overburden well
- Dug well
- Observation well (project well if labeled, nonproject well if unlabeled)
- Test boring (project boring if labeled, nonproject boring if unlabeled)
- Driven point
- Test pit
- Drilled bedrock well
- Potential point source of ground-water contamination
- Bedrock outcrop
- Surface-water drainage-basin boundary; surface-water divides generally correspond to ground-water divides. Horizontal direction of ground-water flow generally is away from divides and toward surface-water bodies.
