

LOST POND  
T15 R6, Aroostook Co.  
U.S.G.S. Portage, Maine

Fishes

None

Physical Characteristics

Area - 6 acres

Temperatures

Maximum depth - 9 feet

Surface - 66° F.

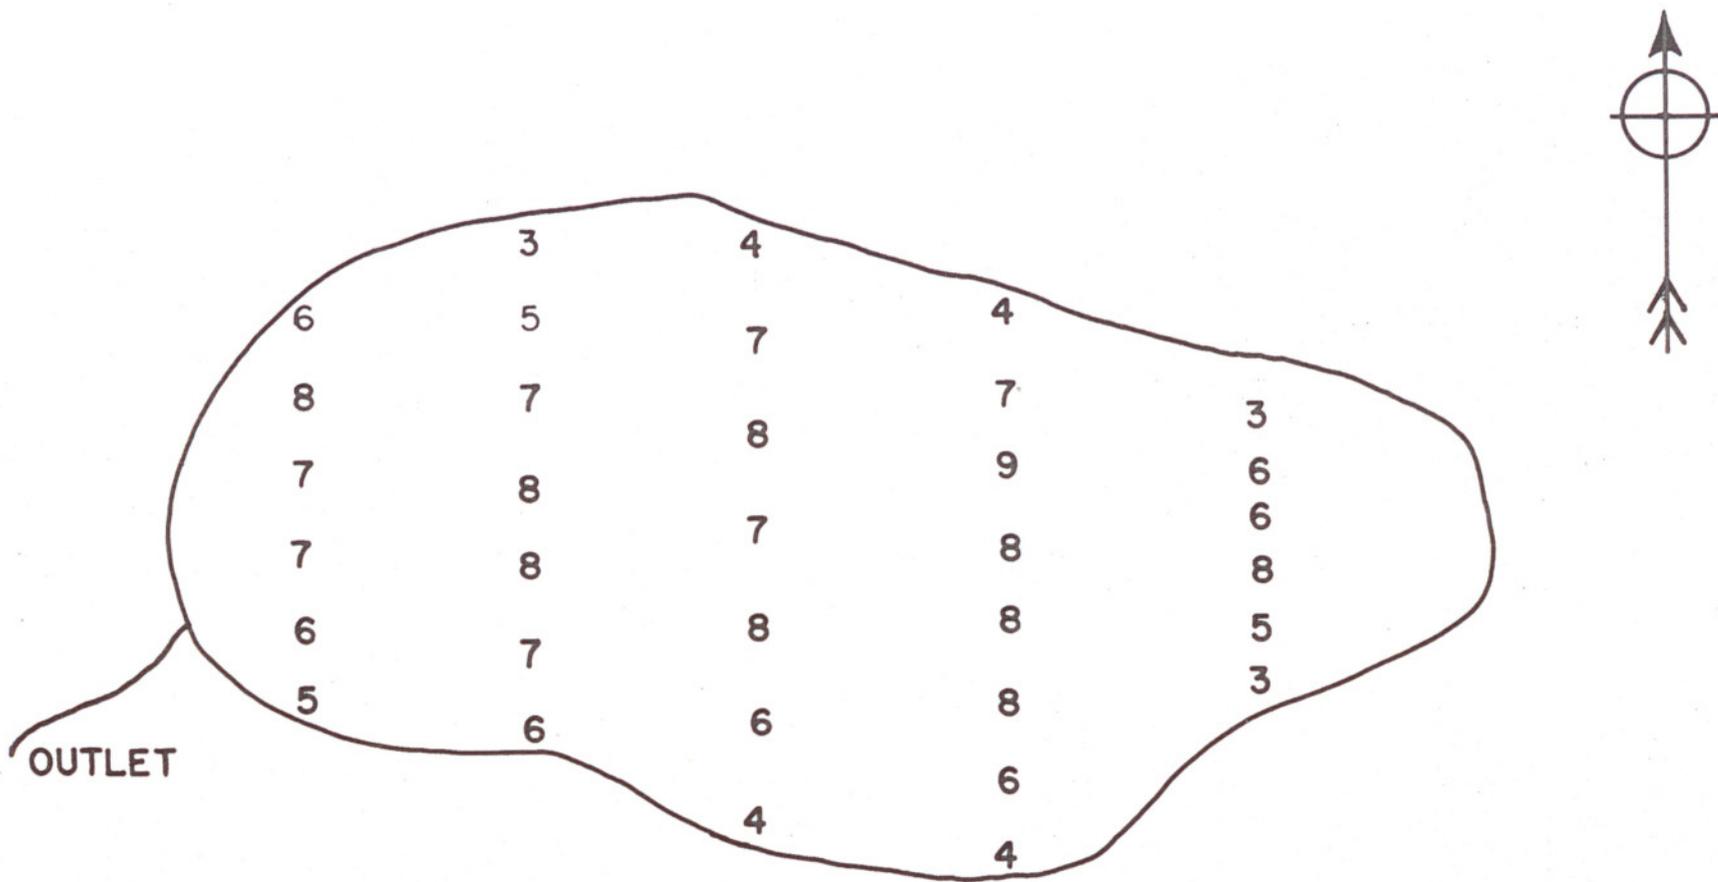

8 feet - 66° F.

Lost Pond is shallow with very clear water and is surrounded by a heath bog. There are abundant spring seepages along the shores. The pond is considered good habitat for brook trout even though its water may become warmer than ideal during hot weather.

Lost Pond apparently supports no fish population at the present time, although brook trout were reportedly once present. Spawning areas for trout are limited to a few gravelly areas along the shores and to the spring seepages. It is possible that former fish populations may have been winterkilled as a result of oxygen depletion under the ice during a severe winter.

It is recommended that several trial stockings of fall fingerling brook trout be made in Lost Pond. If these stockings are successful, periodic stocking may be necessary to maintain the fishery because of the limited spawning areas available.

Lost Pond is accessible by jeep road and trail.
