Bridge # 2019 – N. Main Street
Peru, Maine – Oxford County

PERU, OXFORD COUNTY, MAINE

I. Executive Summary

The focus of this report is the presentation of the routine and fracture critical inspection findings for Maine DOT Bridge No. 2019 (Androscoggin River Bridge) carrying North Main over the Androscoggin River in Peru, Oxford County, Maine.

The bridge was inspected on August 9th, 10th, 13th and 14th, 2012. No underwater inspection was performed. The routine inspection included examination of the gusset plates to determine any section loss and check the straightness of plates. Since the gusset plate thicknesses and plate dimensions for Bridge No. 2019 were not included in the original construction and/or shop drawings made available by Maine DOT, detailed field measurements of the gusset plates were required to be collected as part of the inspection.

A. Significant Findings

1. The transverse construction joint above FB7 in Span 3 has minor spalling of the edges of the joint for the full width of the northbound lane (Photo 5). Above FB4 in Span 3 the transverse construction joint has a one foot square spall patched with bituminous material along the west curb (Photo 6). Above FB1 in Span 3 the transverse construction joint has three small spalls patched with bituminous material (Photo 7).

   Recommendation: Perform spall repairs to the monolithic concrete wearing surface at the three transverse construction joint locations in Span 3.

2. The underside of deck has numerous spalls with exposed reinforcing which are typically concentrated along the inboard edges of S3 and S6 (Photos 16 & 18). Additional spalls in all stringer bays are present along the floorbeam haunch zones, especially over the end floorbeams (Photos 10 & 19).

   Recommendation: Perform concrete spall repairs to the underside of deck to remove and replace unsound concrete.

3. There is no deck joint at the south abutment and the end of the bridge deck has been removed and replaced with bituminous pavement. The bituminous pavement patch is deteriorated and settled in large areas with extensive successive patches placed, resulting in a rough riding surface over the 6-8 foot length approaching the end of the concrete bridge deck (Photo 26). Transverse cracks with heavy efflorescence were observed in the underside of deck above FB8 in Span 3 in all bays between S3 and S6 (Photo 20).

   Recommendation: Perform full depth deck replacement over a five foot length of the deck at the south abutment. Reconstruct the bituminous approach pavement over a length of 10 feet at the south end of the bridge by removing and replacing the pavement full-depth to restore a smooth transition onto the bridge deck.

4. There are substandard steel bridge traffic railings connected to the inner faces of the truss verticals and diagonals along the roadway truss line (Photos 3 & 4). The

traffic railings have impact damage at several locations, damaged or missing bolts at several locations, and are generally in poor condition with missing paint and active corrosion throughout. The steel bar lattice bicycle/pedestrian railing at the outboard edge of the sidewalk is also substandard (Photos 3 & 4).

Recommendation: Replace the steel bridge and sidewalk bicycle/pedestrian railings with new railings which meet current safety standards and criteria.

5. The east sidewalk curb face has a wide horizontal crack at the south end of Span 3 which extends along mid-height of the curb for nearly half of the length of the span (Photo 24). The east sidewalk curb face in Span 2 has a long spall with exposed reinforcing extending from L4 to L6 (Photo 25). The east sidewalk curb face has a wide horizontal crack in Span 2 which extends the full length of the panel between L6 and L7 along mid-height of the curb (Photo 9). The west curb has a 2 foot long severe spall with exposed reinforcing next to the south abutment. There are small spalls with exposed reinforcing in the west curb at both sides of the Pier 2 deck joint. There are small spalls with exposed reinforcing in both curb at both sides of the Pier 1 deck joint.

   Recommendation: Perform spall repairs to the east curb at the south end of Span 3, in Span 2 between L4 to L7. Perform spall repair to the west curb at the south abutment and to both curbs within 3 feet either side of the Pier 1 and 2 deck joints.

6. The sidewalk sliding plate joint at Pier 2 projects upward ¾ to one inch at the plate corner, creating a tripping hazard (Photo 28). A similar condition was observed at the Pier 1 sidewalk sliding plate joint.

   Recommendation: Replace the sidewalk sliding plate joints at Pier 1 and 2.

7. The Span 3 L1-L2 sidewalk truss has up to 8 inch deep debris accumulations between the side channels on the top of the L1 lower tie plate (Photo 31). The Span 3 sidewalk truss at L2 has 9-12 inch deep debris accumulations between the side channels on the lower lateral connection plate (Photo 32). Similar heavy debris accumulations were observed at L6 and L7 in Span 3 with 12 inch and 8 inch depths, respectively.

   Recommendation: High pressure wash the below-deck portions of the sidewalk truss focusing on the lower chord panel points to remove the heavy debris accumulations. High pressure wash the sidewalk truss lower lateral connection plates and the bridge seats to remove the moisture-laden debris deposits.

8. At L5 in the Span 1 roadway truss the vertical U5-L5 has sustained impact damage at the railing level with localized twisting of the member over a three foot length and a permanent bend in the flange tip (Photo 42). At L3 in the Span 3 sidewalk truss the vertical U3-L3 has sustained impact damage over a ten foot height of the west flange at sidewalk level with up to 3 inches of lateral displacement in the longitudinal direction and up to 1 1/2 inches of lateral displacement in the transverse direction (Photo 43). At L6 in the Span 1 roadway truss the vertical U6-L6 has sustained impact damage and a permanent bend in the flange tip (Photo 45). At L2 in the Span 2 roadway truss the vertical U2-L2 has sustained

impact damage and a permanent bend in the flange tip of 1 ½ inches over a length of two feet (Photo 46).

Recommendation: Since the truss verticals experience load reversal and are required to carry compressive dead loads and compressive live loads under certain live loading conditions, the impact damage could decrease the capacity of the member by reducing the compression buckling resistance to a level at which this mode of failure would govern compared to strength. The capacity of these members will be evaluated as part of the load rating to determine the need for repairs.

9. Impact damage to the Span 2 roadway truss L5-U6 diagonal has resulted in a notch in the flange tip which is approximately 2 inches deep (Photo 44). The damage at this location has been considered as section loss since the member is a tension diagonal. Impact damage to the Span 3 sidewalk truss U3-L4 diagonal has resulted in a notch in the flange tip which is approximately 1 inch deep.

   Recommendation: Depending on the results from the load rating analyses, consider adding web plates to these two diagonals to restore the section loss due to the impact damage notches. In any case, notches in FCM tension members are significant FSD's. Hence, the notches should be removed and all sharp edges should be ground smooth.

10. Field-welded plates have been added to the inboard flanges of many of the verticals just below the existing lower transverse sway frame members to cover open holes of the original sway frame connections (Photo 47). These welded plates are FSD's in FCM's which occur in numerous verticals in both truss lines in all 3 spans. A small tack weld was identified in the Span 3 roadway truss at L1 between the lower chord and vertical at a fill plate interface.

    Recommendation: Re-inspect all field weld locations in the vertical FCM's during future biennial bridge inspection cycles. Check for any indications of fatigue cracking initiation as part of the regularly scheduled bridge inspection cycles.

11. Impact damage to the sway frame lower transverse member along with lateral displacement of 6 inches in the horizontal plane was observed at Span 3 U3 (Photo 54). This sway frame also has a slight bend in the sway frame diagonal. Impact damage to the sway frame lower transverse member along with twisting and local vertical bends in the edges of the horizontal legs of the angle over both the northbound and southbound lanes was observed at Span 3 U4 (Photo 55). Impact damage to the sway frame lower transverse member along with lateral displacement in the horizontal plane of more than 3 inches was observed at Span 3 U6 (Photo 56). This sway frame also has a slight bend in the sway frame diagonal. Other locations of sway frame lower transverse member impact damage were observed, such as at Span 1 U2 over the southbound lane (Photo 57).

    Recommendation: Replace the sway frames at the four specified locations. Following completion of the sway frame replacement, the proper alignment and overall geometry of the affected panel points should be verified.

12. The lower lateral bracing angle in Span 2 connecting the FB1 sidewalk truss and FB2 roadway truss is displaced laterally in the horizontal plane by 4 inches (Photo 50). The lower lateral bracing angle in Span 2 connecting FB4 sidewalk truss and FB5 roadway truss is displaced laterally in the horizontal plane by 6 inches (Photo 59). The lower lateral bracing angle in Span 3 connecting the FB1 sidewalk truss and FB2 roadway truss is displaced laterally in the horizontal plane by 6 inches. The lower lateral bracing angle in Span 3 connecting the FB2 sidewalk truss and FB3 roadway truss is displaced laterally in the horizontal plane by 4 inches. The lower lateral bracing angle in Span 3 connecting the FB3 sidewalk truss and FB4 roadway truss is displaced laterally in the horizontal plane by 9 inches (Photo 60). Vertical displacement of approximately six inches was observed in the lower lateral bracing angle in Span 3 connecting the FB5 sidewalk truss and FB6 roadway truss.

    Recommendation: Replace the lower lateral bracing angle at the six specified locations. Following completion of the lower lateral bracing angle replacement, the proper alignment and overall geometry of the affected panel points should be verified.

13. The Span 1 roadway truss expansion bearing at Pier 1 has debris accumulations filling the slot for the southwest anchor bolt, inhibiting free thermal movements (Photo 61)**.** The south abutment expansion bearings have heavy 3-4 inch deep debris accumulations around the bearing and also completely filling the expansion slots and inhibiting free thermal movements (Photo 65)**.**

    Recommendation: Remove the debris accumulations from around the south abutment and Pier 1 expansion bearings as well as from the expansion slots to restore free thermal movements.

14. The bearing pin nuts are completely missing on the east faces of both truss line lower chords at the Span 2 expansion bearings on Pier 2 (Photo 62). The Span 3 sidewalk truss fixed bearing at Pier 2 has a cracked bearing pin nut on the lower chord west face and the lower half of the nut is missing (Photo 63). The bearing pin nut on the west side of the south abutment sidewalk truss bearing is cracked. The bearing pin nut on the east side of the south abutment roadway truss bearing is cracked and the lower half of the nut has fallen away completely from the face of the chord (Photo 66).

    Recommendation: Replace the bearing pin nuts at the five specified locations.

15. The Span 2 sidewalk truss expansion bearing is missing the single west side anchor bolt (Photo 63). The Span 2 roadway truss expansion bearing on Pier 2 is missing the southwest corner anchor bolt (Photo 64).

    Recommendation: Core drill and grout new anchor bolts at the two specified locations.

16. The south abutment breastwall has fine to medium map cracking in the upper five feet, a wide vertical crack at the roadway centerline in the upper two-thirds of the height, and two medium cracks in the lower portion of the breastwall (Photo 67). The wide vertical crack in the breastwall at roadway centerline extends across the

bridge seat and continues upward over the full height of the backwall (Photo 49). The south abutment backwall has severe map cracking outboard of the roadway truss along with heavy spalling in the sloped top portion. The northeast wingwall has map cracking with efflorescence (Photo 68). The southeast wingwall is in fair condition with two spalls less than 2 SF each in size and a medium vertical crack extending from the top to the base (Photo 69). The southwest wingwall is in poor condition with a large deep spall continuous along the top for full length of the wingwall (Photo 70).

Recommendation: Perform epoxy crack injection to repair the cracks in the south abutment and the three specified wingwalls. Perform spall repairs to remove and replace unsound concrete at the two spalls in the southeast wingwall as well as at the large spall in the southwest wingwall.

17. The west end of Pier 2 has a zone of spalls and scaling along the full height of the icebreaker edge (Photo 72).

    Recommendation: Perform spall repairs to remove and replace unsound concrete at the Pier 2 icebreaker edge.

18. The approach guiderails at the southwest and southeast corners are substandard due to lack of stiffening in the transition zones and lack of proper attachments to the bridge railings (Photo 73). The approach guiderail at the northeast corner is also substandard due to lack of stiffening in the transition zone and lack of proper attachment to the bridge railing (Photo 75). The northwest bridge corner is missing guiderail entirely (Photo 75).

    Recommendation: Replace the existing guiderails within 25 feet of each corner of the bridge with properly stiffened guiderail conforming to current standards. Install missing guiderail in the northwest corner

B. Condition Summary

The results of the inspection indicate that the bridge is overall in fair condition.

The **deck** is in fair condition, rated a 5. The transverse construction joints above each floorbeam have spalling along the edges with previous bituminous or concrete patches. The underside of deck has numerous spalls with exposed reinforcing which are typically concentrated along the inboard edges of S3 and S6. The east sidewalk curb face is cracked and deteriorated with spalls over nearly 150 feet of the bridge length. A few patches are present at the deck joints over both piers. A large bituminous patch is present at the south abutment at the end of the concrete bridge deck.

The **superstructure** is in poor condition, rated a 4. Approximately ten of the truss verticals and diagonals have sustained impact damage with several exhibiting permanent twisting and displacement with bent flange edges or notches. End floorbeam paint conditions are poor within all three spans. Numerous lower lateral bracing angles have lateral displacement believed to result from impacts from floating debris during high water periods. Numerous sway frames have sustained impact damage with four locations

warranting replacement of the lower transverse sway frame members. Bearing pin nuts are cracked or completely missing at a total of five locations. Two bearings are each missing an anchor bolt.

The **substructure** is in fair condition, rated a 5. The south abutment contains a wide vertical crack in the breastwall which continues across the bridge seat and up into the backwall. Three of the wingwalls have cracks and spalls with exposed reinforcing. The west end of Pier 2 has spalls and scaling along the full height of the icebreaker edge.

II. Introduction

The focus of this report is the presentation of the routine and fracture critical inspection findings for Maine DOT Bridge No. 2019 (Androscoggin River Bridge) carrying North. Main Street over the Androscoggin River in Peru, Oxford County, Maine.

The bridge was inspected on August 9th, 10th, 13th and 14th, 2012. The inspection team was comprised of Roger Stanley, P.E. (TL), Amy Campo, P.E. (ATL), and Kaon Lam (ATL).

In addition, as specified in the contract, red line markups of the previous Maine DOT Structure Inventory & Appraisal forms have been provided as separate attachments to this report.

Bridge Description

Bridge No. 2019 is a two-lane three span structure with an overall length of 574 feet. Each span consists of a riveted steel Parker through truss measuring 186'-6" from center to center of bearings (Photo on front cover of Report). The bridge was built in 1930 and currently carries two 11 foot wide traffic lanes along with a 5'-0" (+/-) clear sidewalk, located outboard of the east fascia truss along the downstream side. The total out to out width of the bridge roadway and sidewalk measures approximately 30 feet. The trusses are spaced at 24'- 6" center to center.

The substructure consists of two cast-in-place reinforced concrete abutments and two cast-in-place reinforced concrete piers. The two abutments are founded on rock and both piers are supported on piles. The bridge runs from north to south, carrying North Main Street over the Androscoggin River. For purposes of the inspection and Report documentation, plan north has been established to match the original construction plan orientation. The waterway flows downstream to the east.

Various repairs and modifications have been performed since the time of original construction according to plans provided by Maine DOT. Scupper locations have been slightly shifted as described in detail within the Deck Elements section of this report. Both abutments and both faces of both piers have been previously retrofitted with Dywidag post-tensioned concrete encasement repairs immediately below both truss bearings. The original sliding plate deck joints at both piers have been replaced with closed compression seal type deck joints. The lower transverse members at the portal bracing have been replaced with high strength bolted rolled (or welded) shapes at both ends of all three spans.

Inspection Access

The hands-on and visual Routine inspection was performed using an Underbridge Inspection Unit (UB-50) to inspect the underside of the deck, floorbeams, and lower chord members. A 33-foot aerial lift bucket truck was used to reach the upper portion of the truss

(above the deck), sway frames, and top chord lateral bracing members. The truss upper chords were inspected from the deck as well as from the aerial lift. The abutments and wingwalls were also inspected from the Underbridge Inspection Unit.

Prior to the inspection of the bridge, advanced notification to the appropriate authorities was required before performing any lane closures. Maine DOT provided flaggers to implement temporary single lane closures during this inspection.

Fracture Critical Members on this bridge are the tension members of the non-redundant trusses, such as lower chords and all verticals and diagonals except for the U4-L4 vertical and the L0-U1 and U7-L8 end posts which are non-FCM's. In addition, the bottom flange and portions of the floorbeam web that are in tension are also FCM's.

The general layout, framing and orientation foreach of the three spans of the bridge may be viewed on the Fracture- Critical Member (FCM) diagram located in the following section of this Report. Numbering of spans, substructure units, and span panel points used for the inspection is from north to south. Numbering of truss panel points used for the inspection is in accordance with the FCM diagram with L0 corresponding to the north end of each span and L8 corresponding to the north end of each span. Stringer lines designations were assigned looking ahead station from north to south and numbering from left to right. Following this convention, the two sidewalk stringers located outboard of the east truss are designated as S1 and S2, respectively. Stringers S3 to S6 are located between trusses, with S6 being the west fascia stringer.

Additional bridge data can be found in the Maine DOT Structure Inventory and Appraisal Sheet.

III. Fracture Critical Members and Fatigue-Prone Details

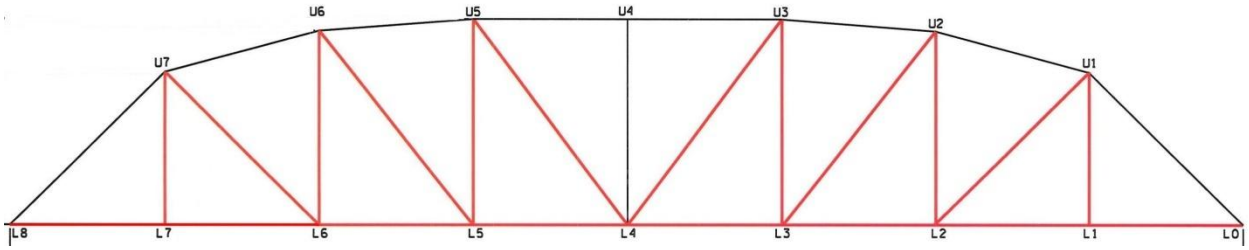
Fracture Critical Members on this bridge are the non-redundant tension members of the trusses along with the floorbeam bottom flange and portions of the floorbeam webs which experience tension loading. The riveted built up truss connections are classified as Fatigue Category D in accordance with AASHTO LRFD Bridge Design Specification, 4th Edition, Table 6.6.1.2.3-1.

Per the requirements of the National Bridge Inspection Standards found in Title 23 Part 650 Subpart C of the Code of Federal Regulations all FCMs were inspected hands-on from a distance no further than arms-length.

Field-welded plates have been added to the inboard flanges of many of the verticals just below the existing lower transverse sway frame members to cover open holes of the original sway frame connections. These welded plates are FSD's in FCM's which occur in numerous verticals in both truss lines in all 3 spans.

Depending on the length, orientation, and thickness of connected elements in these welds, these locations could represent a more severe fatigue category than Category D for the basic riveted built up truss connections. The bridge inspection scope did not include assessment of remaining fatigue life of the structure.

A diagram depicting the truss FCM members highlighted in red is included directly below.



Truss diagram showing Panel Point numbering system

Fracture Critical tension Members shown in **Bolded Red** linestyle (per original contract plan design loads)

IV. Inspection Findings

Deck Elements

The deck elements are in fair overall condition.

Deck & Wearing Surface: The cast-in-place concrete deck has an existing monolithic concrete wearing surface. The transverse construction joint above FB7 in Span 3 has minor spalling of the edges of the joint for the full width of the northbound lane (Photo 5). Above FB4 in Span 3 the transverse construction joint has a one foot square spall patched with bituminous material along the west curb (Photo 6). Above FB1 in Span 3 the transverse construction joint has three small spalls patched with bituminous material (Photo 7). Above FB7 in Span 2 the transverse construction joint has two spalls in the northbound lane measuring 1 to 2 SF in size, each patched with concrete (Photo 8). Above FB7 in Span 1 the transverse construction joint has a 4 SF spall in the northbound lane along the east curb, patched with concrete (Photo 9).

Underside of Deck: Three minor spalls in the underside of deck were noted in the floorbeam haunch zones of FB6 in Span 1 in various stringer bays (Photo 10). Approximately ten transverse cracks with efflorescence were observed in the underside of deck in Span 1 between FB7 and FB8 distributed in three different stringer bays (Photo 11). In Span 2 between FB1 and FB2 two transverse cracks with efflorescence were observed in the underside of the sidewalk slab. At the same location a longitudinal crack with efflorescence was noted along the horizontal construction joint between the sidewalk and the roadway deck slab (Photo 12). In Span 2 between FB3 and FB4 a longitudinal crack with efflorescence was observed between S3 and S4 located just inboard of the east curbline (Photo 13). In Span 2 between FB7 and FB8 four transverse cracks with efflorescence were noted between S5 and S6 (Photo 14).

A 2 foot square spall with exposed reinforcing was observed in Span 2 between FB5 and FB6 below the sidewalk in the outside vertical face of the curb along with efflorescence originating from the interface between the sidewalk to deck slab construction joint (Photo 15). A similar condition was observed in Span 3 between FB5 and FB6.

In Span 3 between FB0 and FB1 five spalls with exposed reinforcing were noted between S5 and S6 (Photo 16).

Patch repairs in the underside of deck were noted around the drainage downspouts at various locations.

Above FB0 in Span 2 all three stringer bays have been patched with repairs measuring 4 feet long by full width of the bay (Photo 17). Several transverse cracks with efflorescence were observed within 10 feet of the end floorbeam at this location.

On the north side of FB2 in Span 2, a 1 foot by 4 foot spall with exposed reinforcing was observed between S5 and S6. On the south side of FB2 in Span 2, a 4 foot by 6 foot concrete patch repair was observed between S5 and S6. In the same panel and

bay two spalls with exposed reinforcing measuring approximately 2 feet square each were observed near mid-panel and at FB3 (Photo 18).

Above FB8 in Span 2 a 1 foot by 2 foot spall was observed in the floorbeam haunch zone between S4 and S5 (Photo 19). At the same location two concrete patches were observed on either side of S5. A transverse crack with efflorescence is present in the patched area between S5 and S6. Two additional concrete patches were observed on either side of S5 above FB0 in Span 3.

In Span 3 above FB1 a spall with exposed reinforcing was observed between S4 and S5 and a wide transverse crack with efflorescence was noted between S3 and S4.

Transverse cracks with heavy efflorescence were observed above FB8 in Span 3 in all bays between S3 and S6 (Photo 20).

Bridge Railings: There are substandard steel bridge railings connected to the inner faces of the truss verticals and diagonals along the west truss line (Photos 3 & 4). The steel bar lattice bicycle/pedestrian railing at the outboard edge of the sidewalk is in fair condition (Photos 3 & 4).

The west traffic railing in Span 1 at L5 has a splice in both rails to repair previous impact damage to the attachments to the truss vertical which is rotated from the collision damage (Photo 21). Impact damage to the railing was observed in Span 3 at L5 (Photo 22). Similar conditions were observed at a few other locations in the railing, including Span 3 at the U1-L2 diagonal and between the Span 1 and Span end posts. At Span 1 the connection to the U2-L3 diagonal has impact damage and three damaged or missing bolts in the upper and lower rail attachments. A few missing bolts were observed at the connections of the railings to the attachment angles at verticals or diagonals (Photo 23).

Sidewalk & Curbs: The east sidewalk curb face has a wide horizontal crack at the south end of Span 3 which extends along mid-height of the curb for nearly half of the length of the span (Photo 24). The east sidewalk curb face in Span 2 has a long spall with exposed reinforcing extending from L4 to L6 (Photo 25). The east sidewalk curb face has a wide horizontal crack in Span 2 which extends the full length of the panel between L6 and L7 along mid-height of the curb (Photo 9).

The west curb has a 2 foot long severe spall with exposed reinforcing next to the south abutment. There are small spalls with exposed reinforcing in the west curb at both sides of the Pier 2 deck joint. There are small spalls with exposed reinforcing in both curb at both sides of the Pier 1 deck joint.

Joints: There is no deck joint at the south abutment and the end of the bridge deck has been removed and replaced with bituminous pavement. The bituminous pavement patch is deteriorated and settled in large areas with extensive successive patches placed, resulting in a rough riding surface over the 6-8 foot length approaching the end of the concrete bridge deck (Photo 26).

The deck joint at Pier 2 has minor spalling with bituminous patches and the joint opening varies along the length of the joint from ¾ inches to zero at the roadway centerline (Photo 27). The sidewalk sliding plate joint at Pier 2 projects upward ¾ to one inch at the plate corner, creating a tripping hazard (Photo 28). A similar condition was observed at the Pier 1 sidewalk sliding plate joint.

The deck joint at Pier 1 has minor spalling in the northbound lane and a one foot by 6 foot spall patched with concrete in the southbound lane (Photo 29).

Deck Drainage: Scuppers exist along both curblines in every other panel and are typically located midway between panel points. Outlets are all clear of debris and functioning properly. The original plans show curb face type scuppers and downspouts in line with the curbs located outboard of Stringers S3 and S6. However, since the as-inspected scuppers and downspouts are actually located within the roadway approximately six inches from the curb faces with downspouts inboard of S3 and S6, the scupper arrangement was apparently modified since original construction. Patch repairs in the underside of deck were noted around the drainage downspouts at various locations with timber formwork left in place, confirming that the scupper positions have been slightly shifted (Photo 14). The downspout pipes extend below the level of the deck and terminate immediately adjacent to the truss lower chords. However, the outlet ends of the drain pipes are typically situated above the underside of the lower chords, exposing the chords to runoff spray.

Superstructure

The superstructure steel elements are in poor condition.

Trusses: The **Upper Chord** members are in fair condition. The paint system is generally intact with minimal failures throughout the exterior and interior surfaces of the upper chords (Photo 30).

The horizontal exposure surfaces such as the top plate are in fair to satisfactory condition with respect to paint system condition.

The **Lower Chords** are in fair condition. The Span 3 L1-L2 sidewalk truss has up to 8 inch deep debris accumulations between the side channels on the top of the L1 lower tie plate (Photo 31). The Span 3 sidewalk truss at L2 has 9-12 inch deep debris accumulations between the side channels on the lower lateral connection plate (Photo 32). Similar heavy debris accumulations were observed at L6 and L7 in Span 3 with 12 inch and 8 inch depths, respectively. Active corrosion was observed in the lower chord bottom interior surfaces along with the lower portions of the vertical and gusset plates at sidewalk truss L6 in Span 3 (Photo 33).

Minor pack rust of the top and bottom splice plates with one inch vertical deformation was observed in the Span 3 roadway truss at the L3 lower chord splice (Photo 34).

A small tack weld was identified in the Span 3 roadway truss at L1 between the lower chord and vertical at a fill plate interface. Fusion to all three components was observed.

Vertical and Diagonal Members are in poor condition. The Span 3 sidewalk truss end post diagonal U7-L8 has sustained approximately six separate one-half inch deep scrapes and gouges in the flange edge due to vehicular impacts. Similar minor scrapes and gouges due to impact damage were observed in the end posts of both truss lines in all three spans. At the Span 1 L0-U1 sidewalk truss end post, a severed lacing bar due to section loss was observed (Photo 35).

At L3 in the Span 2 roadway truss the vertical and diagonal have sustained damage at 2 feet above the lower chord, which has caused localized twisting of the flanges over a one feet length in each member (Photo 36). The west flange of the diagonal U2-L3 is permanently deformed and bent inward by 2-1/2 inches (Photo 37). The west flange of the vertical U3-L3 is permanently deformed and bent outward by 1-1/2 inches (Photo 38). The most likely cause for this damage is large floating debris during a high water event, such as a trapped tree branch getting lodged between the two members.

Previously arrested section loss was observed to the lower end of the Span 2 roadway truss U7-L7 vertical. The vertical at this location has section loss on the east face of the flange up to 3/16 inch deep and 2 inches wide located approximately a foot above the top of the floorbeam (Photo 39). Section loss with active corrosion was observed to the lower end of the Span 2 roadway truss U6-L6 vertical. The vertical at this location has section loss on the east face of the flange up to 1/4 inch deep and 4 1/2 inches wide located approximately two feet above the top of the floorbeam (Photo 40). Section loss with active corrosion was observed to the lower end of the Span 2 roadway truss L5-U6 diagonal. The diagonal at this location has section loss on the east face of the flange up to 3/16 inch deep and 4 inches wide located approximately at top of curb level (Photo 41).

Active corrosion and minor paint loss was observed in the Span 3 roadway truss at the lower end of the L0-U1 end post. An area located immediately below U5 on the west face of the Span 3 sidewalk truss U5-L5 measuring approximately 18 inches tall was observed to have failed paint and active corrosion for full width of the member flange.

At L5 in the Span 1 roadway truss the vertical U5-L5 has sustained impact damage at the railing level with localized twisting of the member over a three foot length and a permanent bend in the flange tip (Photo 42). This location warrants repairs in order to restore capability for carrying compressive loads without buckling.

At L3 in the Span 3 sidewalk truss the vertical U3-L3 has sustained impact damage over a ten foot height of the west flange at sidewalk level with up to 3 inches of lateral displacement in the longitudinal direction and up to 1 1/2 inches of lateral displacement in the transverse direction (Photo 43). The east flange has up to 1 inch lateral displacement in the longitudinal direction and up to 1 1/2 inches of lateral displacement in the transverse direction. This location warrants repairs in order to restore capability

for carrying compressive loads without buckling.

Impact damage to the Span 2 roadway truss L5-U6 diagonal has resulted in a notch in the flange tip which is approximately 2 inches deep (Photo 44). The damage at this location has been considered as section loss since the member is a tension diagonal. Impact damage to the Span 3 sidewalk truss U3-L4 diagonal has resulted in a notch in the flange tip which is approximately 1 inch deep. The damage at this location has been considered as section loss since the member is a tension diagonal.

At L6 in the Span 1 roadway truss the vertical U6-L6 has sustained impact damage and a permanent bend in the flange tip (Photo 45). At L2 in the Span 2 roadway truss the vertical U2-L2 has sustained impact damage and a permanent bend in the flange tip of 1 ½ inches over a length of two feet (Photo 46). These locations warrant repairs in order to restore capability for carrying compressive loads without experiencing member buckling.

The Span 2 roadway truss diagonal U3-L4 has sustained minor impact damage at the railing level where the flange is bent 1 ½ inches over a length of just over a foot. The Span 3 sidewalk truss diagonal L4-U5 has sustained minor impact damage at 28 inches above the sidewalk level where the flange is bent 3/4 inches over a length of a foot. These members are tension diagonals which do not experience load reversal into compression. Therefore no member repairs are deemed necessary at these locations.

Minor scrape marks from impact damage were noted in the Span 3 roadway truss end post U7-L8 as well as in the U7-L7 and U5-L5 verticals. Various other verticals and diagonals exhibit scrape marks from traffic impact, such as at the Span 1 roadway truss U1-L2 diagonal and at the Span 3 U4-L4 vertical.

Field-welded plates have been added to the inboard flanges of many of the verticals just below the existing lower transverse sway frame members to cover open holes of the original sway frame connections (Photo 47). These welded plates are FSD's in FCM's which occur in numerous verticals in both truss lines in all 3 spans.

The Span 2 roadway truss diagonal U1-L2 is missing a single rivet in the east face L2 gusset, leaving 19 of the original total of 20 rivets to resist the member loads (Photo 48).

Floorbeams: The Span 2 FB8 and Span 3 FB0 end floorbeams at Pier 2 have failed paint areas on the webs and bottom flanges with active corrosion full length (Photo 19). In Span 3 the north face of FB1 has poor paint condition on the web between S3 and S4. The Span 3 FB8 end floorbeam has failed paint on the web and active corrosion (Photo 49).

Stringers: Stringers are generally in satisfactory condition with few visible defects (Photo 50). Stringers S2, S3, and S6 have typical areas along the top flange edges with minor paint loss and limited localized active corrosion along the underside of the deck (Photos 15, 16, and 18). Similar minor paint loss to the top flanges was also observed at

the ends of all stringers within 5 feet of the end floorbeams at all deck joints (Photos 11, 14, & 17).

Secondary Members: Top Chord Lateral Bracing- The lower transverse members at the portal bracing have been replaced with high strength bolted rolled shapes at both ends of all three spans (Photo 51). The height of the portal bracing has been raised by shifting the new lower transverse members higher up the end diagonals by approximately 2 feet. High strength bolted repairs were observed in various sway frame connections including the diagonal intersection connection plate at Span 3 U3 (Photo 52).

Impact damage to the portal bracing at the south end of Span 3 over the northbound lane was observed (Photo 53). Minor impact damage to the portal bracing at the south end of Span 1 over the centerline roadway was observed.

Impact damage to the sway frame lower transverse member along with lateral displacement of 6 inches in the horizontal plane was observed at Span 3 U3 (Photo 54). This sway frame also has a slight bend in the sway frame diagonal. Impact damage to the sway frame lower transverse member along with twisting and local vertical bends in the edges of the horizontal legs of the angle over both the northbound and southbound lanes was observed at Span 3 U4 (Photo 55). Impact damage to the sway frame lower transverse member along with lateral displacement in the horizontal plane of more than 3 inches was observed at Span 3 U6 (Photo 56). This sway frame also has a slight bend in the sway frame diagonal. A bend in the upper east sway frame diagonal was noted at Span U1. Other locations of sway frame lower transverse member impact damage were observed, such as at Span 1 U2 over the southbound lane (Photo 57) and at Span 1 U3.

Minor impact damage to the sway frame lower transverse member consisting of small dents and bends was observed at Span 1 U4, U5, and U6.

Minor amounts of rusting and paint loss were observed in the sway frame verticals.

Bottom Chord Lateral Bracing- The Span 3 FB8 sidewalk truss lower lateral bracing connection plate is covered in 2-3 inch deep debris accumulations.

In Span 2 at the FB5 roadway truss lower lateral bracing connection plate pack rust at the floorbeam flange edge has bent the connection downward by approximately one inch (Photo 58). A similar condition with ½ inch of downward displacement of the connection plate was noted at Span 1 at the FB5 roadway truss.

The lower lateral bracing angle in Span 2 connecting the FB1 sidewalk truss and FB2 roadway truss is displaced laterally in the horizontal plane by 4 inches (Photo 50). The lower lateral bracing angle in Span 2 connecting FB4 sidewalk truss and FB5 roadway truss is displaced laterally in the horizontal plane by 6 inches (Photo 59). The lower lateral bracing angle in Span 3 connecting the FB1 sidewalk truss and FB2 roadway truss is displaced laterally in the horizontal plane by 6 inches. The lower lateral bracing

angle in Span 3 connecting the FB2 sidewalk truss and FB3 roadway truss is displaced laterally in the horizontal plane by 4 inches. The lower lateral bracing angle in Span 3 connecting the FB3 sidewalk truss and FB4 roadway truss is displaced laterally in the horizontal plane by 9 inches (Photo 60). The most likely cause of lateral displacement of the lower lateral bracing angles is impact damage from large floating debris during a high water event, such as tree limbs. The direction of the displacements was confirmed to be consistent with the downstream waterway direction in all instances. Vertical displacement of approximately six inches was observed in the lower lateral bracing angle in Span 3 connecting the FB5 sidewalk truss and FB6 roadway truss.

Bearings: The Span 1 roadway truss expansion bearing at Pier 1 has debris accumulations filling the slot for the southwest anchor bolt, inhibiting free thermal movements (Photo 61)**.**

The bearing pin nuts are completely missing on the east faces of both truss line lower chords at the Span 2 expansion bearings on Pier 2 (Photo 62). The Span 3 sidewalk truss fixed bearing at Pier 2 has a cracked bearing pin nut on the lower chord west face and the lower half of the nut is missing (Photo 63). The Span 2 sidewalk truss expansion bearing is missing the single west side anchor bolt and the base of the pedestal casting is rotated slightly compared to the masonry plate (Photo 63). This bearing also has a variable gap along the west face between the underside of the pedestal casting and the top of the bronze plate surface. This condition could be an indication that the bearing pin may not be rotating freely as intended. The Span 2 roadway truss expansion bearing on Pier 2 is missing the southwest corner anchor bolt (Photo 64).

The south abutment expansion bearings have heavy 3-4 inch deep debris accumulations around the bearing and also completely filling the expansion slots and inhibiting free thermal movements (Photo 65)**.** The bearing pin nut on the west side of the sidewalk truss bearing is cracked. The bearing pin nut on the east side of the roadway truss bearing is cracked and the lower half of the nut has fallen away completely from the face of the chord (Photo 66). Based on observation of the paint interfaces at the anchor bolt flat washer plates, it appears that the bearings have not moved to any significant degree since the last bridge re-painting.

Corrosion Losses for Primary Members: Table 1 contains a listing of specific locations where measurable section loss was observed in primary superstructure members, including primary truss members, floorbeams, and stringers. For cases in which section loss was documented in the primary superstructure components, the live load rating computations were prepared to consider the actual remaining section. (The lower lateral bracing and associated connection plates are secondary members which serve to carry wind and lateral loads but do not participate directly in resisting traffic live loads.)

Member	Location	Description
Span 2 roadway truss L5-U6	Approximately 4 feet below mid-height horizontal bracing connection on the east face of the flange	Flange has a 2 inch deep notch due to impact damage (Photo 44-6906).
Span 2 roadway truss U7-L7	Approximately a foot above the top of the floorbeam on the east face of the flange	Section loss up to 3/16 inch deep and 2 inches wide (Photo 39-6913).
Span 2 roadway truss U6-L6	Approximately two foot above the top of the floorbeam on the east face of the flange	Section loss up to 1/4 inches deep and 4 1/2 inches wide (Photo 40-6914).
Span 2 roadway truss L5-U6	Approximately at top of curb level on the east face of the flange	Section loss up to 3/16 inch deep and 4 inches wide (Photo 41-6915).
Span 3 sidewalk truss U3-L4	Approximately 6 feet above curb level on the west face of the flange	Flange has a 1 inch deep notch due to impact damage.

TABLE 1- Locations of Measurable Section Loss in Primary Members

Substructure

The visible substructure elements are in fair condition.

Abutments: Both abutments have been previously retrofitted with Dywidag post-tensioned concrete encasement repairs immediately below both truss bearings (Photo 67). The south abutment breastwall has fine to medium map cracking in the upper five feet, a wide vertical crack at the roadway centerline in the upper two-thirds of the height, and two medium cracks in the lower portion of the breastwall (Photo 67). The wide vertical crack in the breastwall at roadway centerline extends across the bridge seat and continues upward over the full height of the backwall (Photo 49). The south abutment bridge seat is covered with 3-4 inch deep debris accumulations nearly full width of the seat. The south abutment backwall has severe map cracking outboard of the roadway truss along with heavy spalling in the sloped top portion.

Wingwalls: The northeast wingwall has map cracking with efflorescence (Photo 68).

The southeast wingwall is in fair condition with two spalls less than 2 SF each in size and a medium vertical crack extending from the top to the base (Photo 69). The southwest wingwall is in poor condition with a large deep spall continuous along the top for full length of the wingwall (Photo 70).

Piers: Both faces of both piers have been previously retrofitted with Dywidag post-tensioned concrete encasement repairs immediately below both truss bearings (Photo 71). The north face of Pier 1 has minor spalls and scaling (Photo 71). The west end of Pier 2 has a zone of spalls and scaling along the full height of the icebreaker edge (Photo 72).

Channel

There were no major visible deficiencies in the channel. A trapped tree trunk was observed to be lodged on the upstream end of Pier 1 (Photo 71).

Miscellaneous

Approach Pavement: The south approach pavement has numerous wide cracks and depressions which result in a rough surface (Photo 73). At the time of the inspection there was an active construction project underway along US 2 which appeared to include resurfacing work to the north bridge approach which was still to be completed (Photo 74).

Approach Curb: NA.

Approach Guiderails: The approach guiderails at the southwest and southeast corners are substandard due to lack of stiffening in the transition zones and lack of proper attachments to the bridge railings (Photo 73). The approach guiderail at the northeast corner is also substandard due to lack of stiffening in the transition zone and lack of proper attachment to the bridge railing (Photo 75). The northwest bridge corner is missing guiderail entirely (Photo 75).

Load Posting: The bridge is not currently posted for live load.

Signage: No vertical clearance signs are posted on the approach roadways or on the structure. There is a bridge ID marker located at the southeast leading end corner of the structure.

Utilities: Three under-deck utility pipe conduits are located between S3 and S4 running full length of the bridge (Photo 76). These conduits are suspended directly from hanger supports embedded in the deck slab and pass through cut-outs in the floorbeam webs. At the FB8 end floorbeam in Span 2 these three metallic conduits are severely corroded and completely perforated, exposing the electrical cables over a one foot length (Photo 77).

Between S5 and S6 in Span 1 there is an abandoned former messenger cable which extends over portions of the bridge length (Photo 78).

V. Conclusions and Recommendations

The results of the inspection indicate that the bridge is overall in fair condition.

- The **deck** is in fair condition, rated a 5. The transverse construction joints above each floorbeam have spalling along the edges with previous bituminous or concrete patches. The underside of deck has numerous spalls with exposed reinforcing which are typically concentrated along the inboard edges of S3 and S6. The east sidewalk curb face is cracked and deteriorated with spalls over nearly 150 feet of the bridge length. A few patches are present at the deck joints over both piers. A large bituminous patch is present at the south abutment at the end of the concrete bridge deck.
- The **superstructure** is in poor condition, rated a 4. Approximately ten of the truss verticals and diagonals have sustained impact damage with several exhibiting permanent twisting and displacement with bent flange edges or notches. End floorbeam paint conditions are poor within all three spans. Numerous lower lateral bracing angles have lateral displacement believed to result from impacts from floating debris during high water periods. Numerous sway frames have sustained impact damage with four locations warranting replacement of the lower transverse sway frame members. Bearing pin nuts are cracked or completely missing at a total of five locations. Two bearings are each missing an anchor bolt.
- The **substructure** is in fair condition, rated a 5. The south abutment contains a wide vertical crack in the breastwall which continues across the bridge seat and up into the backwall. Three of the wingwalls have cracks and spalls with exposed reinforcing. The west end of Pier 2 has spalls and scaling along the full height of the icebreaker edge.

Recommendations:

We recommend that the following safety improvements, repairs or rehabilitation, and/or monitoring should be made to retard further deterioration, preserve the structural integrity of the bridge, and extend its useful life:

1. Perform spall repairs to the monolithic concrete wearing surface at the three transverse construction joint locations in Span 3.
2. Perform concrete spall repairs to the underside of deck to remove and replace unsound concrete.
3. Perform full depth deck replacement over a five foot length of the deck at the south abutment. Reconstruct the bituminous approach pavement over a length of 10 feet at the south end of the bridge by removing and replacing the pavement full-depth to restore a smooth transition onto the bridge deck.
4. Replace the steel bridge and sidewalk bicycle/pedestrian railings with new railings which meet current safety standards and criteria.

5. Perform spall repairs to the east curb at the south end of Span 3, in Span 2 between L4 to L7. Perform spall repair to the west curb at the south abutment and to both curbs within 3 feet either side of the Pier 1 and 2 deck joints.

6. Replace the sidewalk sliding plate joints at Pier 1 and 2.

7. High pressure wash the below-deck portions of the sidewalk truss focusing on the lower chord panel points to remove the heavy debris accumulations. High pressure wash the sidewalk truss lower lateral connection plates and the bridge seats to remove the moisture-laden debris deposits.

8. Since the truss verticals experience load reversal and are required to carry compressive dead loads and compressive live loads under certain live loading conditions, the impact damage could decrease the capacity of the member by reducing the compression buckling resistance to a level at which this mode of failure would govern compared to strength. The capacity of these members will be evaluated as part of the load rating to determine the need for repairs.

9. Depending on the results from the load rating analyses, consider adding web plates to these two diagonals to restore the section loss due to the impact damage notches. In any case, notches in FCM tension members are significant FSD's. Hence, the notches should be removed and all sharp edges should be ground smooth.

10. Re-inspect all field weld locations in the vertical FCM's during future biennial bridge inspection cycles. Check for any indications of fatigue cracking initiation as part of the regularly scheduled bridge inspection cycles.

11. Replace the sway frames at the four specified locations. Following completion of the sway frame replacement, the proper alignment and overall geometry of the affected panel points should be verified.

12. Replace the lower lateral bracing angle at the six specified locations. Following completion of the lower lateral bracing angle replacement, the proper alignment and overall geometry of the affected panel points should be verified.

13. Remove the debris accumulations from around the south abutment and Pier 1 expansion bearings as well as from the expansion slots to restore free thermal movements.

14. Replace the bearing pin nuts at the five specified locations.

15. Core drill and grout new anchor bolts at the two specified locations.

16. Perform epoxy crack injection to repair the cracks in the south abutment and the three specified wingwalls. Perform spall repairs to remove and replace unsound

concrete at the two spalls in the southeast wingwall as well as at the large spall in the southwest wingwall.

17. Perform spall repairs to remove and replace unsound concrete at the Pier 2 icebreaker edge.

18. Replace the existing guiderails within 25 feet of each corner of the bridge with properly stiffened guiderail conforming to current standards. Install missing guiderail in the northwest corner.

Appendix A

Inspection Photographs

Photo 1 – Downstream elevation looking southwest. (Note- See Report cover for upstream elevation photo).

Photo 2 – View of bridge looking north from the south approach roadway.

Photo 3 – General top of deck, looking north in Span 3 from the south abutment.

Photo 4 – Top of deck, looking north from above the south pier (Pier 2).

Photo 5 – The transverse construction joint above FB7 in Span 3 has minor spalling of the edges of the joint for the full width of the northbound lane. Looking west.

Photo 6 – Above FB4 in Span 3 the transverse construction joint has a one foot square spall patched with bituminous material along the west curb. Looking west.

Photo 7 – Above FB1 in Span 3 the transverse construction joint has three small spalls patched with bituminous material.

Photo 8 – Above FB7 in Span 2 the transverse construction joint has two spalls in the northbound lane measuring 1 to 2 SF in size, each patched with concrete.

Photo 9 – Above FB7 in Span 1 the transverse construction joint has a 4 SF spall in the northbound lane along the east curb, patched with concrete. Looking east.

Photo 10 – Three minor spalls in the underside of deck were noted in the floorbeam haunch zones of FB6 in Span 1 in various stringer bays. View between S4 and S5.

Photo 11 – Approximately ten transverse cracks with efflorescence in the underside of deck in Span 1 between FB7 and FB8, distributed in three different stringer bays.

Photo 12 – In Span 2 between FB1 and FB2 two cracks with efflorescence in sidewalk slab and a longitudinal crack with efflor. along sidewalk horizontal construction joint .

Photo 13 – In Span 2 between FB3 and FB4 a longitudinal crack with efflorescence was observed between S3 and S4 located just inboard of the east curbline. Looking east.

Photo 14 – In Span 2 between FB7 and FB8 four transverse cracks with efflorescence were noted between S5 and S6 in top portion of photo. Looking east.

Photo 15 – A 2 foot square spall with exposed reinforcing in Span 2 between FB5 & FB6 along with efflorescence at sidewalk to deck slab construction joint. Looking southwest.

Photo 16 – In Span 3 between FB0 and FB1 five spalls with exposed reinforcing were noted between S5 and S6. View is looking south.

Photo 17 – Above FB0 in Span 2 all three stringer bays have been patched with repairs measuring 4 feet long by full width of the bay. Looking north at Pier 1.

Photo 18 –In Span 2 between S5 and S6 two spalls with exposed reinforcing measuring approximately 2 feet square each, near mid-panel and at FB3. View is looking south.

Photo 19 – Above FB8 in Span 2 a 1 foot by 2 foot spall was observed in the floorbeam haunch zone between S4 and S5 at top left. Also note concrete patches in both bays.

Photo 20 – Transverse cracks with heavy efflorescence were observed above FB8 in Span 3 in all bays between S3 and S6. Looking south at south abutment.

Photo 21 – West traffic railing in Span 1 at L5 has a splice in both rails to repair previous impact damage. Note truss vertical is rotated from collision damage. Looking west.

Photo 22 – Impact damage to the west traffic railing was observed in Span 3 at L5. Looking north in southbound lane.

Photo 23 – A few missing bolts were observed at the connections of the railings to the attachment angles at verticals or diagonals. View is at Span 3 U3-L4.

Photo 24 – East sidewalk curb face has a wide horizontal crack at south end of Span 3 which extends along mid-height of curb for nearly half of the length of the span.

Photo 25 – The east sidewalk curb face in Span 2 has a long spall with exposed reinforcing extending from L4 to L6. Looking northeast.

Photo 26 – South abutment bituminous pavement patch is deteriorated with extensive successive patches, resulting in a rough riding surface at the concrete bridge deck.

Photo 27 – Pier 2 deck joint has minor spalling with bituminous patches and the joint opening varies along the length of the joint from ¾ inches to zero at roadway centerline.

Photo 28 – The sidewalk sliding plate joint at Pier 2 projects upward ¾ to one inch at plate corner, creating a tripping hazard. Similar condition was observed at Pier 1 joint.

Photo 29 – The deck joint at Pier 1 has minor spalling in the near northbound lane and a one foot by 6 foot spall patched with concrete in the far southbound lane.

Photo 30 – Paint system is generally intact with minimal failures throughout exterior and interior surfaces of upper chords. View inside Span 3 sidewalk truss U3-U4.

Photo 31 – The Span 3 L1-L2 sidewalk truss has up to 8 inch deep debris accumulations between the side channels on the top of the L1 lower tie plate.

Photo 32 – The Span 3 sidewalk truss at L2 has 9-12 inch deep debris accumulations between the side channels on the lower lateral connection plate.

Photo 33 – Active corrosion was observed in lower chord bottom interior surfaces along with lower portions of vertical and gusset plates at sidewalk truss L6 in Span 3.

Photo 34 – Minor pack rust of the top and bottom splice plates with one inch vertical deformation was observed in the Span 3 roadway truss at the L3 lower chord splice.

Photo 35 – At the Span 1 L0-U1 sidewalk truss end post, a severed lacing bar due to section loss was observed just below top of sidewalk level. Looking north.

Photo 36 – At L3 in Span 2 roadway truss the vertical and diagonal have sustained damage at 2 feet above the lower chord, with localized twisting of the flanges.

Photo 37 – The west flange of the Span 2 roadway truss diagonal U2-L3 is permanently deformed and bent inward by 2-1/2 inches. Looking north.

Photo 38 – The west flange of the Span 2 roadway truss vertical U3-L3 is permanently deformed and bent outward by 1-1/2 inches. Looking south.

Photo 39 – The Span 2 roadway truss U7-L7 vertical has section loss on east face of flange up to 3/16 inch deep and 2 inches wide located a foot above top of the floorbeam.

Photo 40 – Span 2 roadway truss U6-L6 vertical has section loss on east face of flange up to 1/4 inch deep and 4 1/2 inches wide located two feet above top of floorbeam.

Photo 41 – Span 2 roadway truss L5-U6 diagonal has section loss on the east face of the flange up to 3/16 inch deep and 4 inches wide located at top of curb level.

Photo 42 –The Span 1 roadway truss U5-L5 has sustained impact damage at railing level with localized twisting over a three foot length and a permanent bend in the flange tip.

Photo 43 – Span 3 sidewalk truss U3-L3 has impact damage with up to 3 inches of lateral displacement in longitudinal direction and up to 1 1/2 inches in the transverse direction.

Photo 44 – Impact damage to the Span 2 roadway truss L5-U6 diagonal has resulted in a notch in the flange tip which is approximately 2 inches deep.

Photo 45 – At L6 in the Span 1 roadway truss the vertical U6-L6 has sustained impact damage and a permanent bend in the flange tip. Looking south.

Photo 46 – At L2 in the Span 2 roadway truss the vertical U2-L2 has sustained impact damage and a permanent bend in the flange tip of 1 ½ inches over a length of two feet.

Photo 47 – Field-welded plates added to many verticals just below existing lower transverse sway frame members to cover open holes of original sway frame connections.

Photo 48 – The Span 2 roadway truss diagonal U1-L2 is missing a single rivet in the east face L2 gusset, leaving 19 of the original total of 20 rivets to resist the member loads.

Photo 49 – The Span 3 FB8 end floorbeam has failed paint on the web and active corrosion. Looking south at south abutment between S4 &S5. Note crack in backwall.

Photo 50 – Stringers generally in satisfactory condition with few defects. Note displacement in Span 2 bracing connecting FB1 sidewalk and FB2 roadway trusses.

Photo 51 – The lower transverse members at portal bracing have been replaced with bolted rolled shapes at both ends of all three spans. View at north portal of Span 1.

Photo 52 – High strength bolted repairs were observed in various sway frame connections including the diagonal intersection connection plate at Span 3 U3.

Photo 53 – Impact damage to the portal bracing at the south end of Span 3 over the northbound lane was observed.

Photo 54 – Impact damage to the sway frame lower transverse member along with lateral displacement of 6 inches in the horizontal plane was observed at Span 3 U3.

Photo 55 – Impact damage to Span 3 U4 sway frame lower transverse member along with twisting and local vertical bends in edges of horizontal legs of angles over both lanes.

Photo 56 – Impact damage to the sway frame lower transverse member along with lateral displacement in the horizontal plane of more than 3 inches was observed at Span 3 U6.

Photo 57 – Sway frame lower transverse member impact damage at Span 1 U2 over southbound lane. Also note welded plate on vertical below sway frame strut.

Photo 58 – In Span 2 at FB5 roadway truss lower lateral connection pack rust at floorbeam flange edge has bent the connection plate down by approximately one inch.

Photo 59 – The lower lateral bracing angle in Span 2 connecting FB4 sidewalk truss and FB5 roadway truss is displaced laterally in the horizontal plane by 6 inches.

Photo 60 – The lower lateral bracing angle in Span 3 connecting the FB3 sidewalk truss and FB4 roadway truss is displaced laterally in the horizontal plane by 9 inches.

Photo 61 – The Span 1 roadway truss expansion bearing at Pier 1 has debris accumulations filling the slot for the southwest anchor bolt, inhibiting free movements.

Photo 62 – The bearing pin nuts are missing on the east faces of both truss line lower chords at Span 2 expansion bearings on Pier 2. Looking west with Span 2 on right.

Photo 63 – Span 3 sidewalk truss bearing at Pier 2 has a cracked bearing pin nut and lower half of the nut is missing (at right). Also note missing anchor bolt in Span 2 bearing.

Photo 64 – The Span 2 roadway truss expansion bearing on Pier 2 is missing the southwest corner anchor bolt. Looking southeast with Span 2 on left, Span 3 on right.

Photo 65 – South abutment expansion bearings have heavy 3-4 inch deep debris accumulations around the bearing and also filling the anchor bolt expansion slots.

Photo 66 – The bearing pin nut on the east side of the roadway truss bearing is cracked and the lower half of the nut has fallen away completely from the face of the chord.

Photo 67 – Both abutments have been retrofitted with Dywidag post-tensioned concrete encasement repairs immediately below both truss bearings. View at south abutment. Also note wide vertical crack in breastwall at centerline of bridge and two lower cracks.

Photo 68 – The northeast wingwall has map cracking with efflorescence.

Photo 69 – The southeast wingwall is in fair condition with two spalls less than 2 SF each in size and a medium vertical crack extending from the top to the base.

Photo 70 – The southwest wingwall is in poor condition with a large deep spall continuous along the top for full length of the wingwall.

Photo 71 – Both faces of both piers have been previously retrofitted with Dywidag post-tensioned concrete encasement repairs immediately below both truss bearings.

Photo 72 – The west end of Pier 2 has a zone of spalls and scaling along the full height of the icebreaker edge. Looking east in the downstream direction at upstream end of pier.

Photo 73 – The south approach pavement has numerous wide cracks and depressions which result in a rough surface. Also note substandard southwest corner guiderail.

Photo 74 – At time of inspection there was an active construction project underway along US 2 which appeared to include resurfacing work to north approach still to be completed.

Photo 75 – Approach guiderail at the northeast corner is substandard due to lack of stiffening and proper attachment to bridge railing. Northwest corner is missing guiderail.

Photo 76 – Three under-deck utility pipe conduits are located between S3 and S4 running full length of the bridge. Looking north. Note hanger rods embedded in deck.

Photo 77 – At the FB8 end floorbeam in Span 2 the three metallic conduits are severely corroded and completely perforated, exposing the electrical cables over a one foot length.

Photo 78 – Between S5 and S6 in Span 1 there is an abandoned former messenger cable which extends over portions of the bridge length. Looking south.

Items to be verified in the Field: 8/2/2012

1. No shop drawings were provided for this structure, so we have no details of the gusset plates. Please field measure each unique gusset plate on the sidewalk and roadway truss.
2. Confirm presence of utilities; 1978 documents reference an added sewer main.

BRIDGE NOTES

1930 Three span, riveted steel, through truss supporting concrete deck.

Inventory Load Rating very low.

PAST INSPECTION

Inspection Date: 08/16/2010 Type: 1 Regular NBI

Inspector: DTJHANN Pontis User Key: DTJHANN - JAMIE

Scope:

NBI: ☑ Other: ☐ Element: ☑

Underwater: ☐ Fracture Critical: ☐

INSPECTION NOTES

Structure is in overall Fair condition.
Used UBC to inspect bridge.
Chain drag of the entire deck found only minor areas of delaminated concrete primarily around joint areas.
Bearing nut on SW bearing is backed off by 3/4"
Note that the nut is not painted and may have been part of the retrofit.
All four abutment bearings have been retrofitted with a catcher¿s mit.
Several of the keeper nuts on the bearing pins are cracked, broken or missing, see photos.
The South end of the center span bearings are tipped back.
There is a cable that has been strung around all of the bearings on the S'ly pier, but is not tight enough to do much.

Two locations of collision damage to verticals.
First is located on down stream side, center of S'ly span. Collision damage to vertical has twisted it out of plane by 2 ±
