## HORIZONTAL/VERTICAL ALIGNMENT

## SUBMITTALS

Submit the following:

- Completed Highway Design Requirements Form (one per speed zone)
- 1 Half Size set of plans including:
o Preliminary Typical Sections
o Plans
- Include existing topo, wetlands, R/W
- Label begin/end stations
- Annotate with curve data
- Show preliminary slope impacts
o Profiles
- Annotate with curve data
o Cross-sections (include critical drive sections)
- Show preliminary slope impacts
- Superelevation Table

## PROJECT DATA

Provide a detailed scope description.
Highway reconstruction beginning at Toothaker Pond Rd in Phillips and extending Northerly 4.61 miles on Route 4.

## TYPICAL SECTION

Complete the table with basic Typical Section data.

| Lane Width: | $11^{\prime}$ |
| :--- | :--- |
| Shoulder Width: | $4^{\prime}$ |
| Cross-slopes: | $2 \%$ travelway, $2 \%$ <br> shoulders |
| Side-slopes: | $4: 1$ |
| Ditch Depth: | $1^{\prime}$ below subgrade |

COMMENTS - provide additional discussion to help the review/check team.

## DESIGN REVIEW/CHECK SUBMITTAL

## HORIZONTAL ALIGNMENT

Complete the table and provide additional tables for side roads as necessary.

COMMENTS - provide additional discussion to help the review/check team.
Design Speed (typically equals posted speed)
50 mph from STA. $500+00$ to STA. $641+32$
40 mph from STA. $641+32$ to STA. $675+81$
50 mph from STA. 675+81 to STA. 743+52.16
Minimum Radius The minimum radius for 40 mph is 510’ according to HDG Table 5-2. The minimum radius for 50 mph is $835^{\prime}$ according to HDG Table $5-2$. The proposed minimum radius for this design is 625 ' in the 40 mph section and 950 ' in the 50 mph section

Middle Ordinate for Stopping Sight Distance (requires a graphical check) The middle ordinate for the proposed curves was determined by using the formula in HDG Figure 5-8. There are multiple curves along the project where existing tree lines are within the middle ordinate distance. These areas will need to be cleared if the area is outside of clearing limits for slope impacts. The additional clearing will insure that middle ordinate distances are met.

Superelevation The maximum allowed superelevation rate according to HDG Table 7-2 for rural arterials is 6\%. The proposed maximum superelevation for this design is $6 \%$.

Curve Length (not a controlling criteria) Recommended minimum curve length for 40 mph is 600 ' using the formula on p5-6 of HDG. Recommended minimum curve length for 50 mph is 750 ' using the formula on p5-6 of HDG. Many of the horizontal curves have lengths less than the minimum recommended length. These curves were designed with less than ideal curve lengths to minimize impacts to existing land owners and due to the fact that the proposed alignment roughly matches the existing alignment. The existing alignment is not deficient in regards to any controlling criteria other than middle ordinate which will be addressed with clearing.

Off-tracking (check that shoulder width is adequate to accommodate offtracking) Many of the proposed horizontal curves on this project require widening greater than 2' according to HDG Figure 5-3. Full depth paved shoulders will be considered along the project in at least these areas.

## DESIGN REVIEW/CHECK SUBMITTAL

## VERTICAL ALIGNMENT

Complete the table and provide additional tables for side roads as necessary.

50 mph from STA. 675+81 to STA. 743+52.16

## Grade (consider truck lane warrants)

Some grades warrant truck lanes based on speed reduction but do not meet criteria \#1 and \#2 on page 244 of AASHTO Geometric Design of Highway and Streets. Truck lanes are not included in the proposed design.

Stopping Sight Distance The required stopping sight distance for 40 mph is 305' according to HDG Table 4-1. The required stopping sight distance for 50 mph is 425’ according to HDG Table 7-2. All proposed vertical curves exceed the required stopping sight distance.

Curve Length Recommended minimum curve length for vertical crest and sag curves at 40 mph is 120 ' using the formula on p4-17 and p4-19 of HDG. Recommended minimum curve length for vertical crest and sag curves at 50 mph is 150 ' using the formula on p4-17 and p4-19 of HDG. Proposed vertical crest and sag curves exceed minimum curve length requirements.

## INTERSECTION SIGHT DISTANCE
