

SECTION 5

Noise

Section 5. Noise

A. Narrative.

Attached is a comprehensive noise study completed by RSG for the proposed Silver Maple Wind project dated July 16, 2019. This study was completed based on the requirements of the Town of Clifton development ordinance as well as the Maine Department of Environmental Protection regulations. Of important note, the Town of Clifton regulations and requirements exceed those of the MDEP. Please see the accompanying report in Exhibit 5.1.

1.0 INTRODUCTION

The Silver Maple Wind Project (Silver Maple) is a proposed wind power project in Clifton, Maine. In preparation for permitting, SWEB Development has retained RSG to conduct a noise impact assessment for the project in accordance with Clifton, Maine regulations for wind energy facilities. This report includes:

- A project description;
- Sound level limits applicable to the project;
- Background sound level monitoring procedures and results;
- Sound propagation modeling procedures and results; and
- Conclusions.

A primer explaining basic acoustical concepts and terminology is found in Appendix A.

2.0 PROJECT DESCRIPTION

The proposed Silver Maple Wind Project is proposed to be located near the Village of Clifton, Maine. A map of the project, shown in relation to the surrounding area is shown in Figure 1. Maine Route 9 (Airline Road) runs just to the north and west of the project area at an approximate distance of 3,270 meters (2 miles). Maine Route 180 (Rebel Hill Road) passes to the north and east at an approximate distance of 1,620 meters (5,315 feet). Bangor Water Works Road passes to the south and west at a distance of at least 1,460 meters (4,790 feet). The closest residence to the project is located 1,215 meters (3,990 feet) away to the north.

A map showing the project layout is shown in Figure 2. The project will be located directly adjacent to the existing Pisgah Mountain Wind Project, which includes five Vestas V90 1.8 MW turbines on 95-meter tall towers. Silver Maple is currently proposed to have a total of five Vestas V136 4.0 MW turbines, equipped with serrated trailing edges (STE) for noise mitigation. These turbines have 136-meter diameter rotors, situated on 105-meter or 117-meter towers, with a total power output of 4 MW each, for a total project output of 20 MW. Ancillary to the project will be a transformer-containing substation, located approximately 328 meters (1,076 feet) to the northwest of the eastern string of Silver Maple turbines 130 meters (427 feet) west of the existing Pisgah Mountain substation.

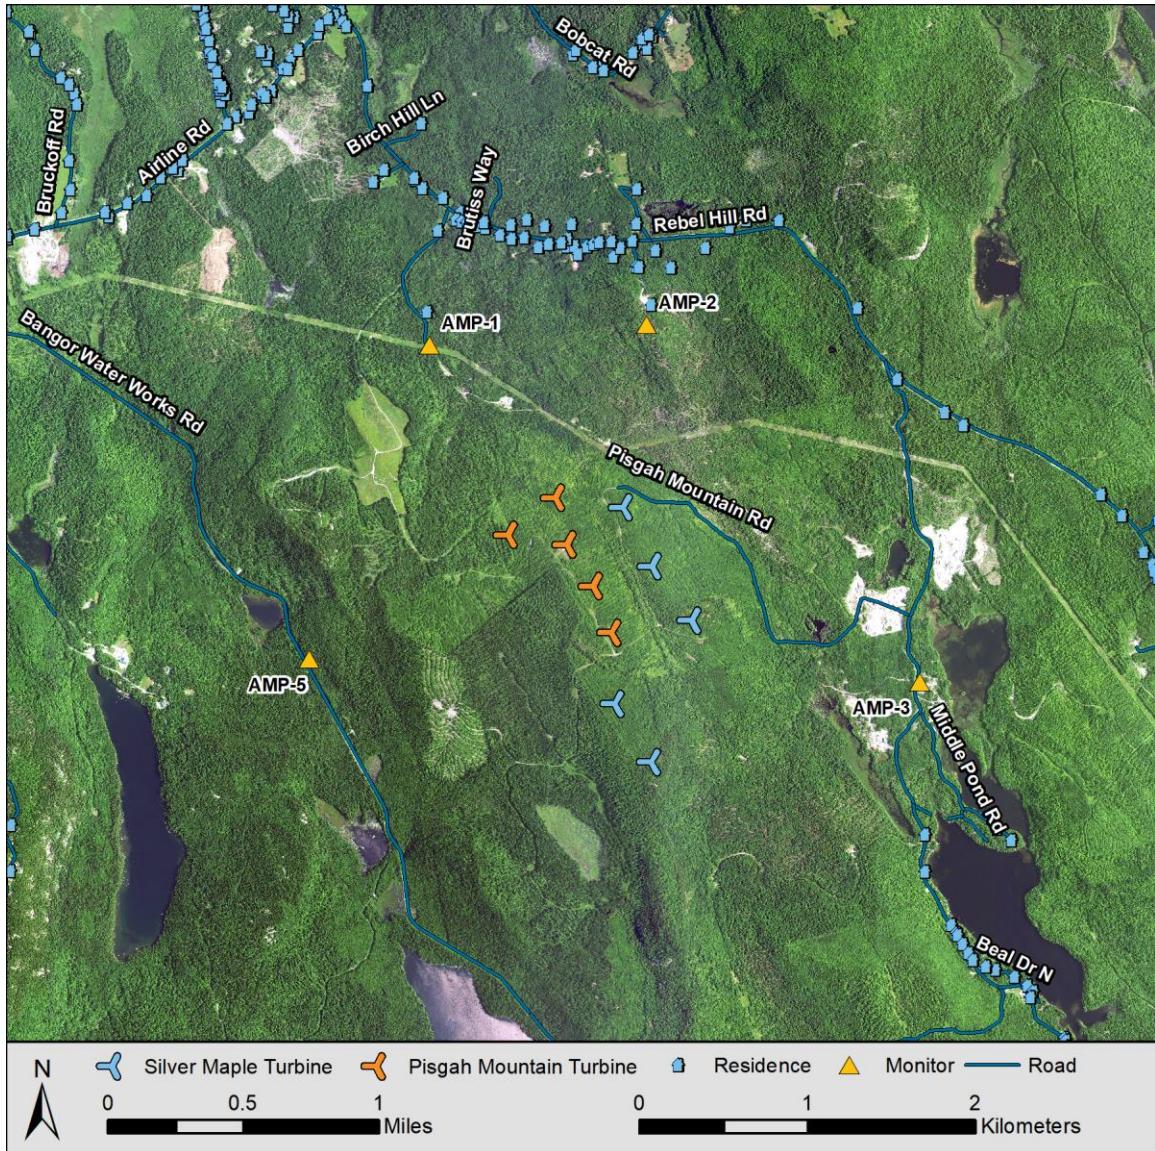

FIGURE 1: PROJECT AREA MAP

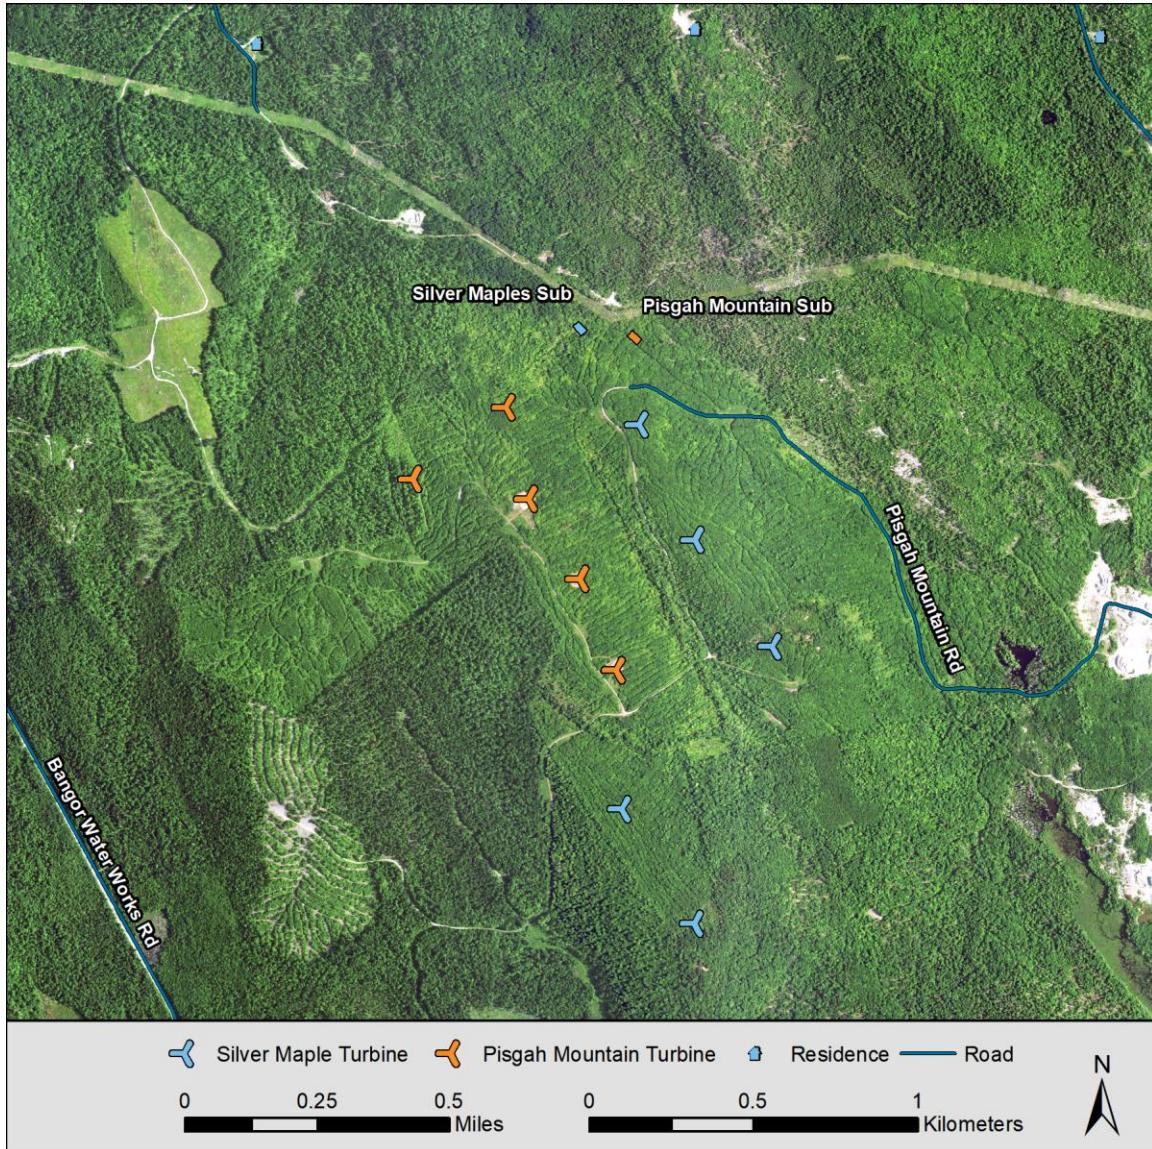

FIGURE 2: PROJECT SITE MAP

3.0 SOUND LEVEL STANDARD

The sound level limits that are applicable to the Project are set forth in Section 14.8.6.1 of the Clifton Land Use Ordinance, Article 14 (“Ordinance”). The limits are:

“14.8.6.1.3. Within 100 ft of a Sensitive Receptor on non-participating or non-project parcels the average L_{90A} (10 minute) sound limit is 35 dBA. Compliance is as determined in Article 14.8.A (Appendix A).

“14.8.6.1.4. At the property line of non-participating or non-project parcels the average L_{90A} (10 minute) sound limit is 45 dBA. Compliance is as determined in Article 14.8.A (Appendix A).

“14.8.6.1.5. A 5 dB penalty is applied for tones as defined in Article 18, tonal penalty, actually measured at a measurement point. The 5 dB penalty shall be added to any average 10-minute sound level (L_{90A} 10-min) for which a tonal sound occurs.”

These limits are applied to wind turbine sound only, and Article 14.8.A.5. defines a sound monitoring protocol where turbines are shutdown periodically so that background sound level measurements can be made. The limits are 35 dBA L₉₀ within 100 feet of nonparticipating receptors and 45 dBA L₉₀ at nonparticipating property lines.

Article 14 also sets requirements for background sound level monitoring found in 14.8.A.3., which include:

- 7-inch or larger wind screens;
- Meteorological measurements within 5 meters of the microphone;
- Microphone heights of 1.2 to 1.5 meters (3.9 to 4.9 feet);
- Use of at least one on-site 10-meter meteorological tower;
- A frequency range from 12.5 Hz to 20 kHz; and
- A distance of at least 15 feet from any reflective surface.

4.0 BACKGROUND SOUND LEVEL MONITORING

4.1 PROCEDURE

Sound level monitoring took place from November 15 to December 6, 2017. ANSI/IEC Type 1 sound level meters were positioned at each location for the duration of the monitoring period. A table showing the manufacturer and model of the sound level meter at each location is shown in Table 1. Microphones were mounted on wooden stakes at a height of approximately 1.4 meters (4.6 feet) and covered with ACO Pacific 7-inch hydrophobic windscreens to reduce the influence of wind-caused turbulence on measurements. The sound level meters were calibrated before and after measurements, with a Type-1 acoustical calibrator emitting a 94-dB tone at 1 kHz. Each sound level meter was set to log A-weighted and 1/3 octave band sound levels at a 50-millisecond interval over the entire period. This data was then summarized in 10-minute periods. The summary for each period includes overall equivalent average sound levels (L_{eq}), upper and lower tenth percentile sound levels (L_{10} and L_{90}), and 1/3 octave band sound levels. Depending on the meter, digital audio was recorded either internally or externally at a minimum sampling rate of 24 kHz and a minimum depth of 24 bits. Externally recorded audio (Larson Davis meters) was stored in compressed .mp3 format and internally recorded audio (Svantek meters) was stored in uncompressed .wav format.

Wind speed data was collected at all monitoring locations using Onset Hobo weather sensors and data loggers. Wind direction was also collected at location AMP-1, temperature at AMP-2 and AMP-3, and rainfall at AMP-3. Weather data was logged at one-minute intervals over the entire monitoring period.

TABLE 1: SUMMARY OF EQUIPMENT FOR EACH MONITORING LOCATION¹

Monitor	Sound Level Meter				Microphone				Preamplifier		Onset HOBO Logger

4.2 LOCATIONS

AMP-1 Description

AMP-1 was located just after the end of Woodchuck Hill Road in a power line cut. An image of the monitoring setup is shown in Figure 3, and Figure 4 is a map of the monitoring location. The monitor was situated approximately 6 meters (20 feet) from the tree-line in waist-high grass. Rebel Hill Road (Maine Route 180) was located approximately 780 meters (2,560 feet) to the northeast. A residence was located approximately 140 meters (460 feet) to the north.

This monitor was set at a relatively low elevation relative to the Project, contributing to lower wind speeds at the microphone. This combined with trees being located further away resulted in lower levels of wind-caused sound. During the monitoring period, there was some logging that took place near this monitor, creating higher sound level spikes.

FIGURE 3: PHOTOGRAPH OF THE AMP-1 MONITOR

FIGURE 4: AMP-1 MONITOR LOCATION

AMP-2 Description

AMP-2 was located approximately 390 meters (1,280 feet) south and above Rebel Hill Road (Maine Route 180). Figure 5 is a picture of the monitoring setup, and Figure 6 is a map of the monitoring location. The location was approximately 125 meters (410 feet) south of the closest residence to the Project.

The monitor was situated at the side of a lightly used ATV trail, surrounded by low-lying brush. Nearby trees are a mix between coniferous and deciduous. The monitor was located on a knoll above the surrounding area.

FIGURE 5: PHOTOGRAPH OF THE AMP-2 MONITOR

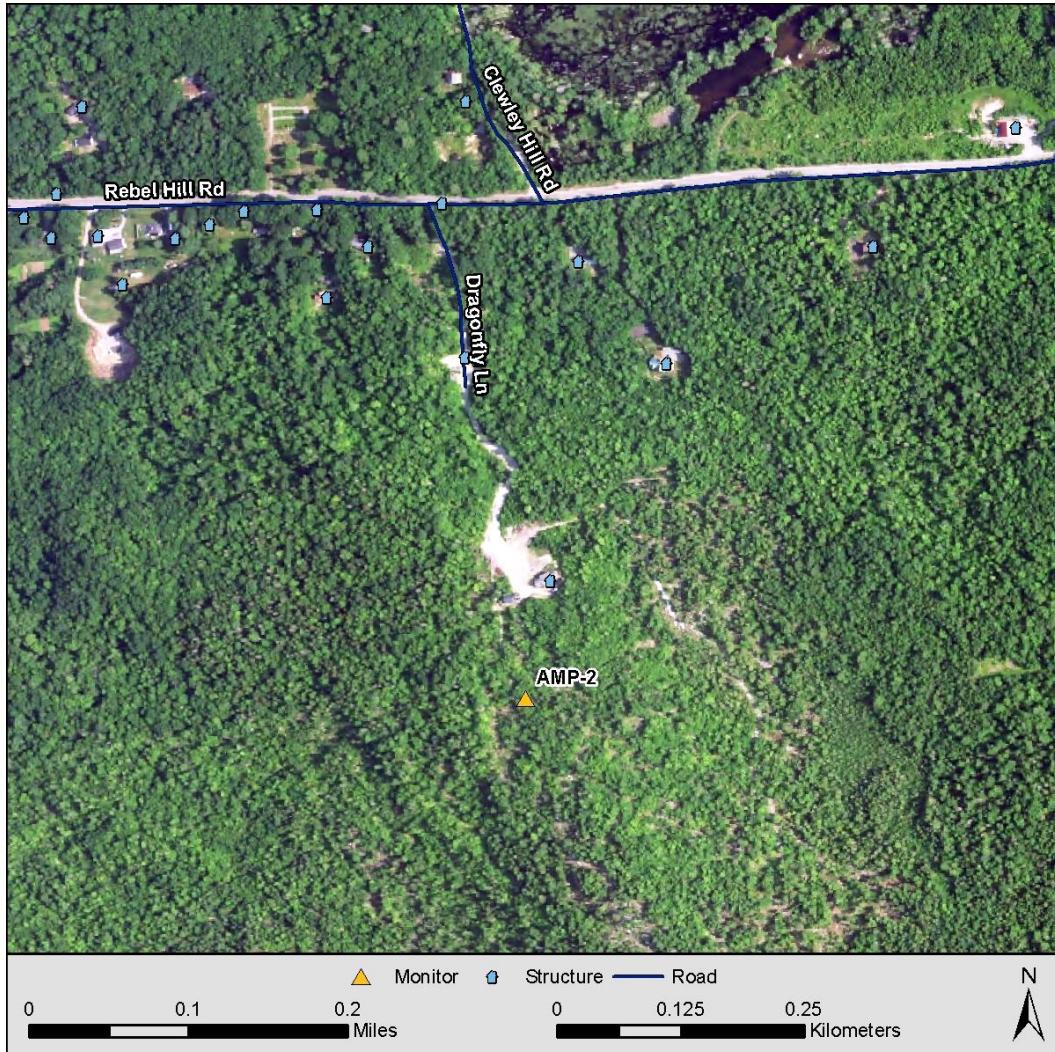

FIGURE 6: AMP-2 MONITOR LOCATION

AMP-3 Description

AMP-3 was located just to the east of Springy Pond Road. Figure 7 shows a picture of the monitor setup, and Figure 8 shows a map of the location. The intersection between Springy Pond Road and Rebel Hill Road (Maine Route 180) was approximately 1,880 meters (6,170 feet) to the north. Upper Springy Pond was located approximately 175 meters (574 feet) to the east.

The monitor was located near the edge of an abandoned gravel pit, and the surrounding ground was primarily packed gravel. Surrounding vegetation was a mix of coniferous and deciduous with minimal groundcover.

Two operational gravel pits were located to the north of the monitor on either side of Springy Pond Road. Both pits were active during the monitoring period.

FIGURE 7: PHOTOGRAPH OF THE AMP-3 MONITOR

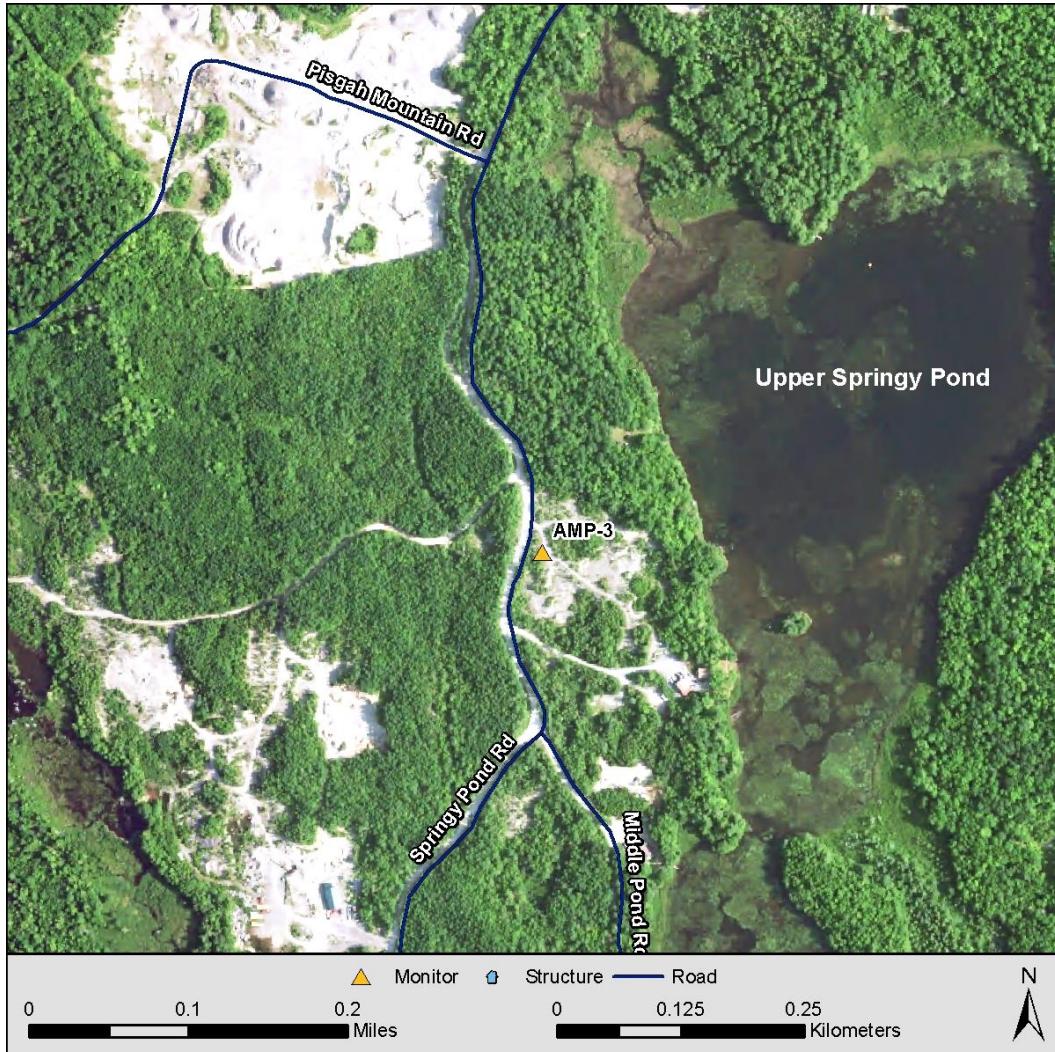

FIGURE 8: AMP-3 MONITOR LOCATION

AMP-5 Description

AMP-5 was located near Bangor Water Works Road. Figure 9 shows a picture of the monitor setup, and Figure 10 is a map of the monitor location. The monitor was situated near a lightly used hiking trail that heads up the ridge towards the Project. The monitor is not near any residence.

The monitor is at a relatively low elevation and surrounded by coniferous trees. Although the monitor is located near a roadway, Bangor Water Works Road has restricted access and so traffic is very light.

FIGURE 9: PHOTOGRAPH OF THE AMP-5 MONITOR

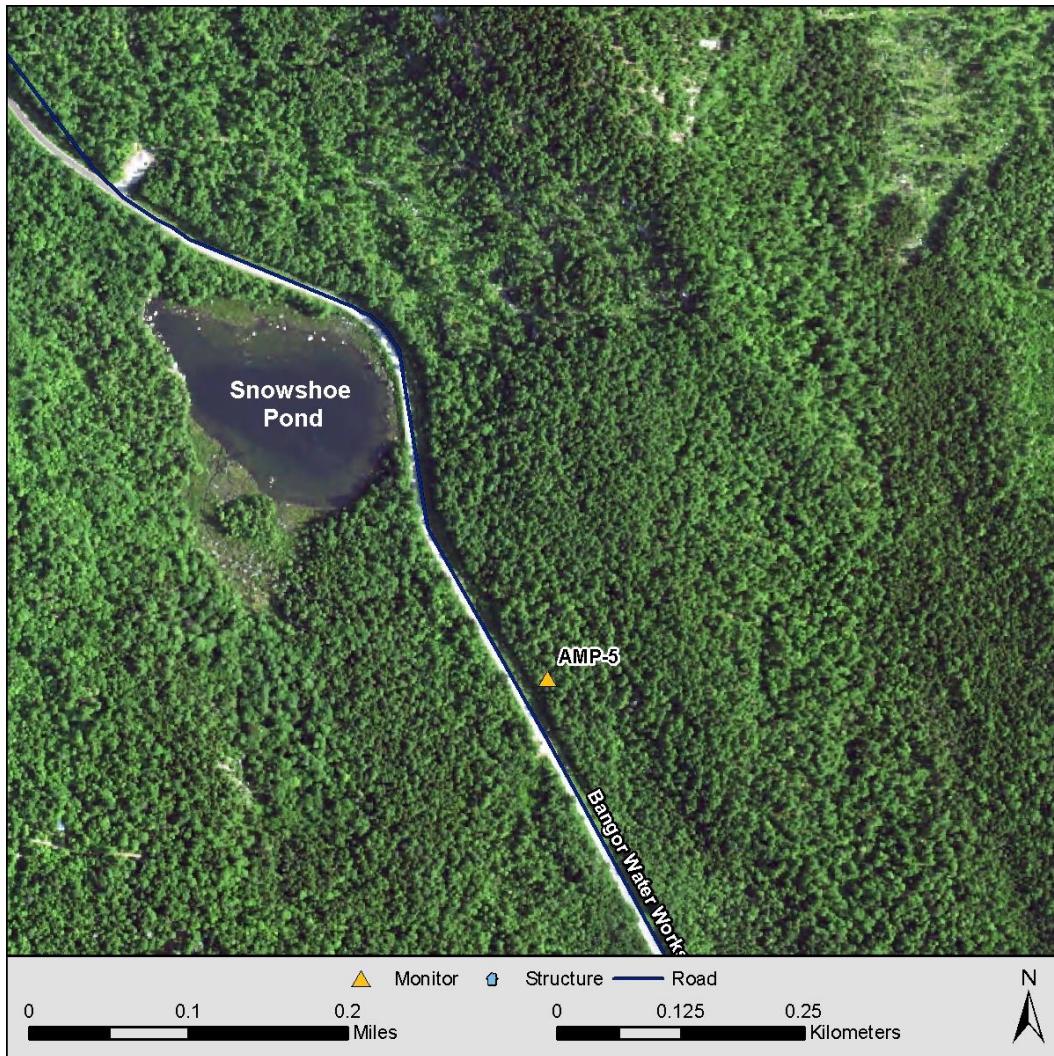

FIGURE 10: AMP-5 MONITOR LOCATION

4.3 RESULTS

Summary of All Sites

A summary of the sound levels monitored at each site by daytime and nighttime periods over the entire monitoring period is provided in Table 2. The data shown in Table 2, excludes data that was collected during periods of high wind speeds (greater than 5 m/s or 11 mph), low temperatures (less than 14°F), and precipitation.

As shown in Table 2, the average daytime sound levels across the monitored sites were between 34 and 36 dBA (LA_{eq}), while the average nighttime sound levels across the monitored sites were between 32 and 35 dBA.

TABLE 2: SUMMARY OF MONITORED SOUND LEVELS AT EACH SITE BY DAY & NIGHT²

Site	Period	L _{Aeq}	L _{A90}	L _{A10}	L _{Ceq}	L _{C90}	L _{C10}
AMP-1	Day	36	32	38	49	46	51
	Night	34	31	36	47	44	49
AMP-2	Day	36	32	39	49	45	50
	Night	35	31	38	48	44	50
AMP-3	Day	36	28	37	50	44	52
	Night	32	26	33	47	42	48
AMP-5	Day	34	28	36	45	41	47
	Night	32	26	34	42	38	44

AMP-1 Results

Time history results for AMP-1 are shown in Figures 11 to 14. Each figure provides the equivalent sound level (L_{EQ}), 10th-percentile sound level (L_{90}), and 90th-percentile sound level (L_{10}) in 10-minute increments. Also provided are the wind speed at microphone height, the wind speed at a 10-meter height, wind direction, and the average power output of the Pisgah Mountain turbines. Periods where data was excluded due to high wind gusts, rain, and low temperatures (below 14°F) are also shown in the graphs.

Biogenic and geophonic (naturally caused) sound sources at AMP-1 were birds and wind blowing through the trees. Anthropogenic (human-caused) sound sources included, airplane overflights, wind turbines (Pisgah Mountain), car pass-bys on Rebel Hill Road, and trucks on the driveway that passes close to the monitor. Starting on November 28, there was logging activity in the area, indicated by numerous sound level spikes shown in Figure 13 and 14. The sound level spikes on November 22 are due to a series of truck pass-bys, as well as a battery update and download of the sound level meter.

Sound levels at the site, in the absence of logging operations are most correlated to ground level wind speeds and distant traffic. Sound levels at the site follow a day-to-day (diurnal) pattern with sound levels decreasing at night, except when ground level wind speeds are elevated or there is precipitation. Diurnal sound level patterns are generally due to transportation sound.

The monitoring results including A-weighted and C-weighted values are also provided in tabular format in Appendix B.

² The data summarized in Table 2 excludes the highest 10% and lowest 10% of all valid measurements as specified in the Clifton Land Use Ordinance Section 14.8.A.4.2(i).

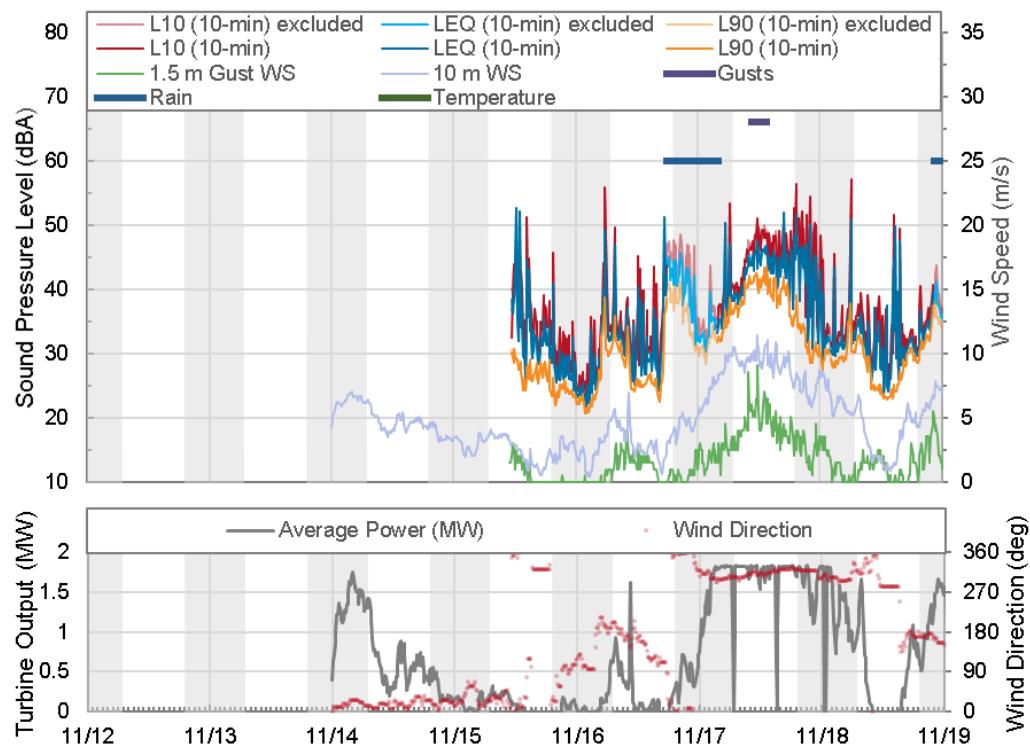

FIGURE 11: AMP-1 SOUND LEVEL TIME-HISTORY - WEEK 1

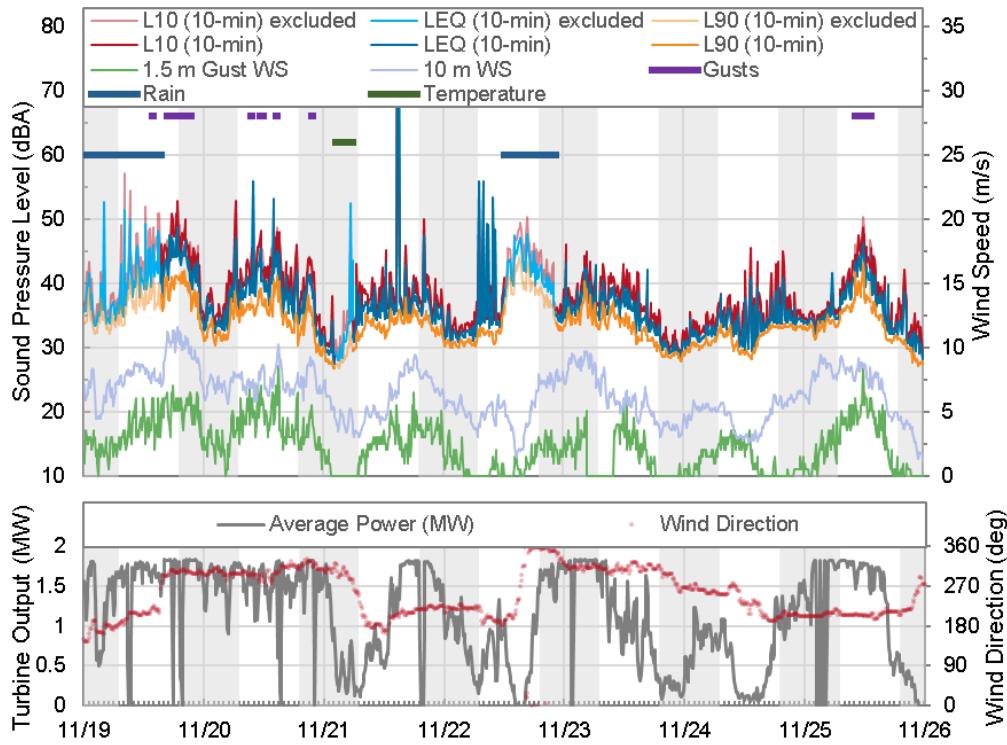

FIGURE 12: AMP-1 SOUND LEVEL TIME-HISTORY - WEEK 2

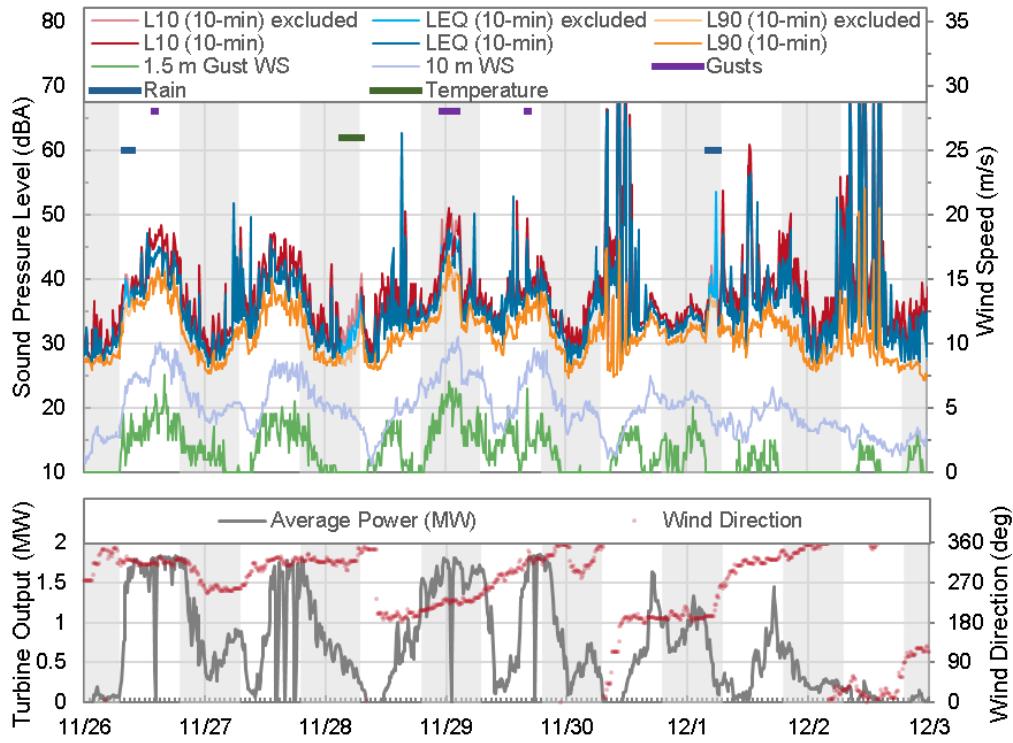

FIGURE 13: AMP-1 SOUND LEVEL TIME-HISTORY - WEEK 3

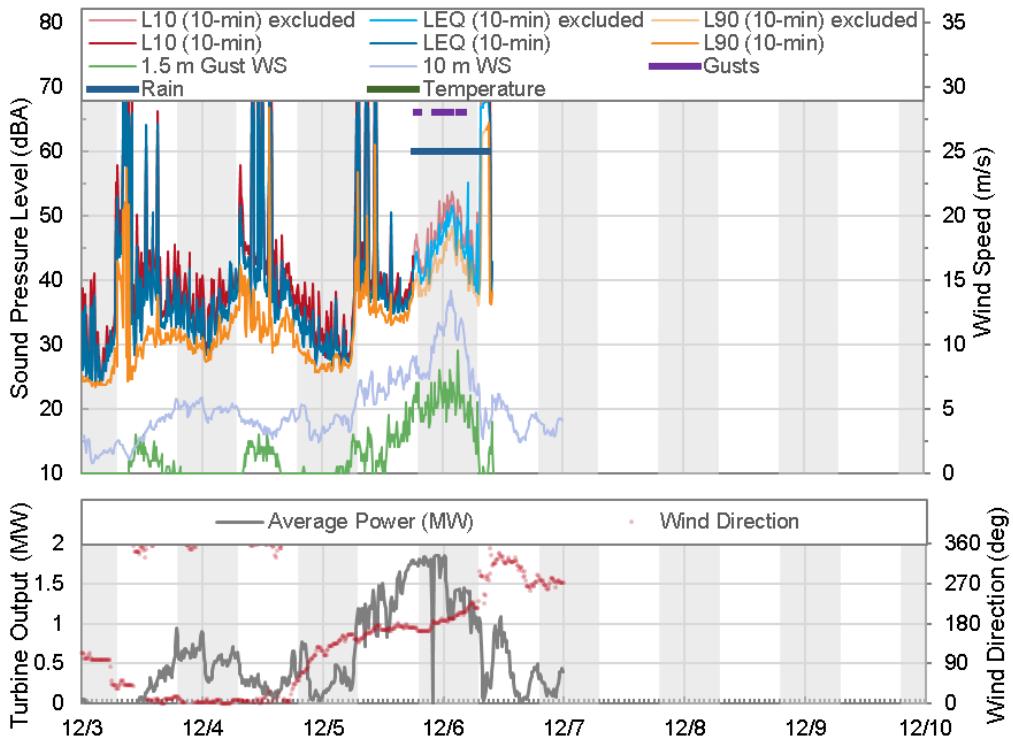

FIGURE 14: AMP-1 SOUND LEVEL TIME-HISTORY - WEEK 4

AMP-2 Results

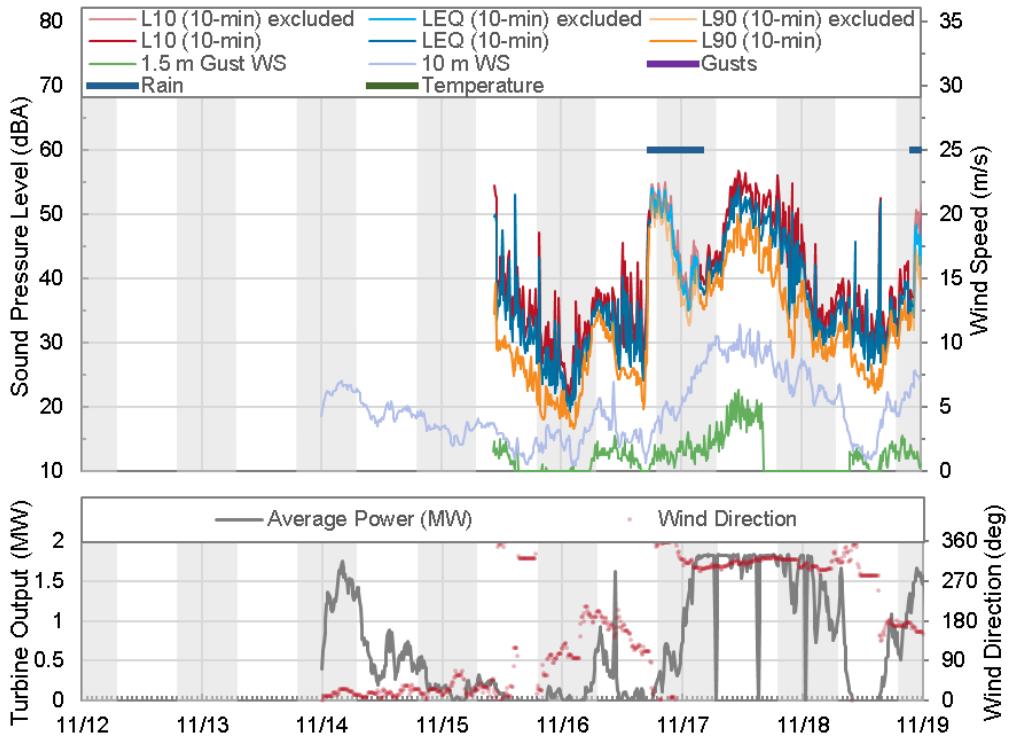

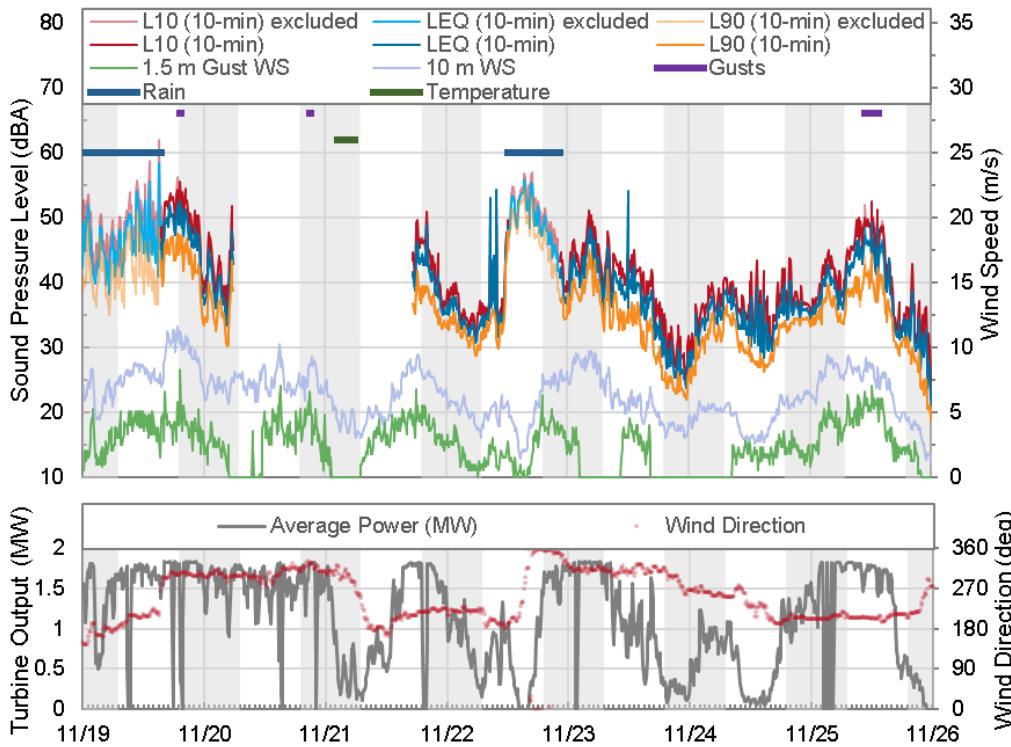

Time-history graphics for AMP-2 are shown in Figures 15 through 18. Each figure provides the equivalent sound level (L_{EQ}), 10th-percentile sound level (L_{90}), and 90th-percentile sound level (L_{10}) in 10-minute increments. Also provided are the wind seed at microphone height, the wind speed at a 10-meter height, wind direction, and the average power output of the Pisgah Mountain turbines. Periods where data was excluded due to high wind gusts, rain, and low temperatures (below 14°F) are also shown in the graphs.

Biogenic and geophonic sound sources at this site included wind in the trees, domesticated animals, birds, and insects. Anthropogenic sources included car pass-bys on Rebel Hill Road (Maine Route 180), the occasional ATV pass-by, and airplane overflights. Wind turbine noise was only occasionally audible, during periods with low background sound levels.

Early in the monitoring period sound levels did not follow a consistent diurnal pattern, although this changed later in the monitoring period. The change is likely due to a reduced number of passing weather fronts and lower overall wind speeds. Sound levels are most related to ground-level wind speeds, with occasional spikes caused by vehicle pass-bys and airplane overflights.

The monitoring results including A-weighted and C-weighted values are also provided in tabular format in Appendix B.

**FIGURE 15: AMP-2 SOUND LEVEL TIME-HISTORY – WEEK 1****FIGURE 16: AMP-2 SOUND LEVEL TIME-HISTORY - WEEK 2**

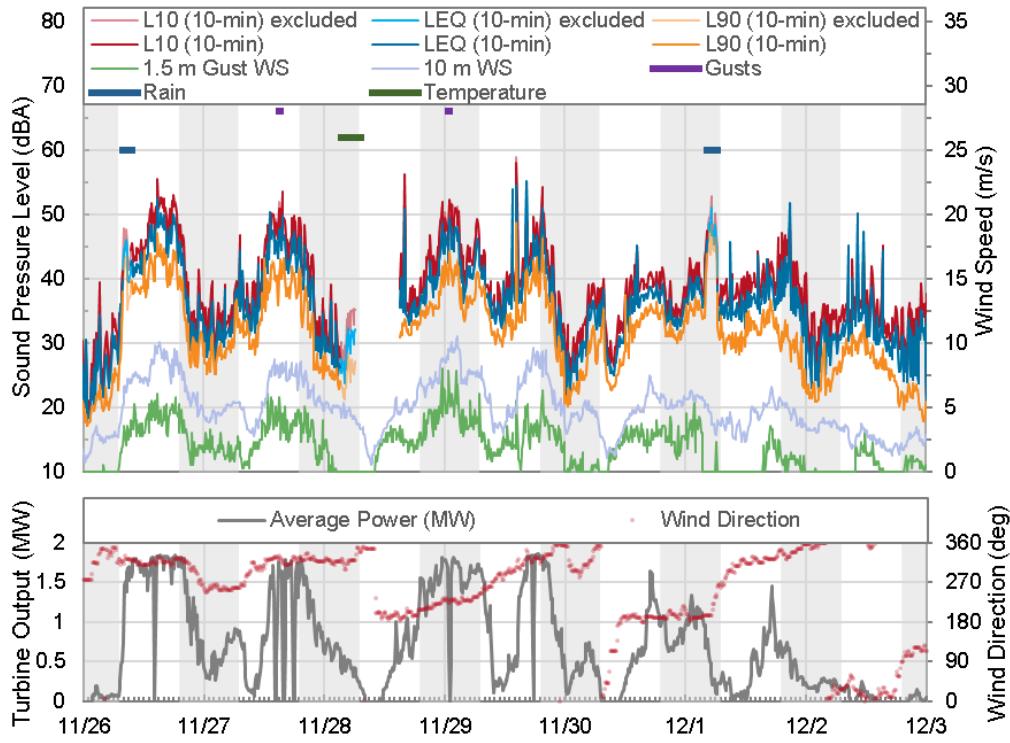

FIGURE 17: AMP-2 SOUND LEVEL TIME-HISTORY - WEEK 3

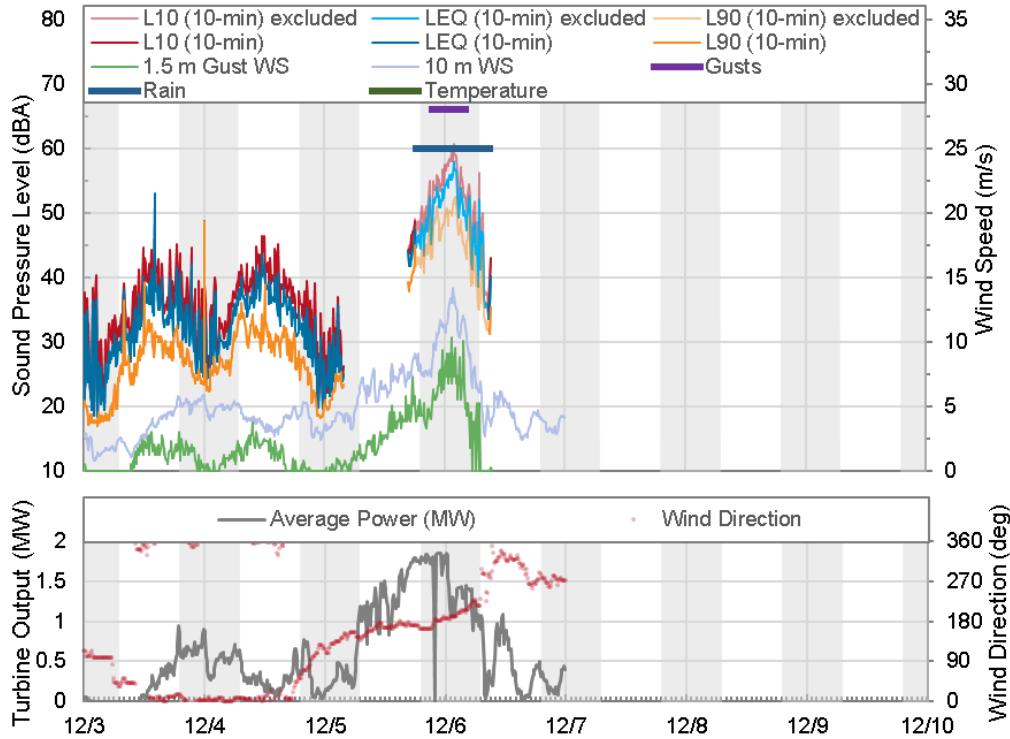

FIGURE 18: AMP-2 SOUND LEVEL TIME-HISTORY - WEEK 4

AMP-3 Results

Time-history graphics for AMP-3 are shown in Figures 19 through 22. Each figure provides the equivalent sound level (L_{eq}), 10th-percentile sound level (L_{90}), and 90th-percentile sound level (L_{10}) in 10-minute increments. Also provided are the wind seed at microphone height, the wind speed at a 10-meter height, wind direction, and the average power output of the Pisgah Mountain turbines. Periods where data was excluded due to high wind gusts, rain, and low temperatures (below 14°F) are also shown in the graphs.

The main anthropogenic sound sources at this site included occasional airplane overflights, relatively frequent car pass-bys on Springy Pond Road, and operations at the two nearby gravel pits. Biogenic and geophonic sound sources included wind in the trees and birds. Wind turbine noise was only occasionally audible at this site.

Sound levels at this site are somewhat diurnal in pattern. Levels are generally lower at night, but the main pattern is that the sound level metrics converge at night, that is the L_{10} , L_{90} , and L_{eq} are closer together at night than during the day. This is due to car pass-bys on Springy Pond Road. Short duration car pass-bys increase L_{10} and L_{eq} levels during the day, while the L_{90} remains relatively low. As traffic decreases during the night, the influence on the L_{10} and L_{eq} decreases leading to lower levels for these metrics and a convergence of all three metrics.

The monitoring results including A-weighted and C-weighted values are also provided in tabular format in Appendix B.

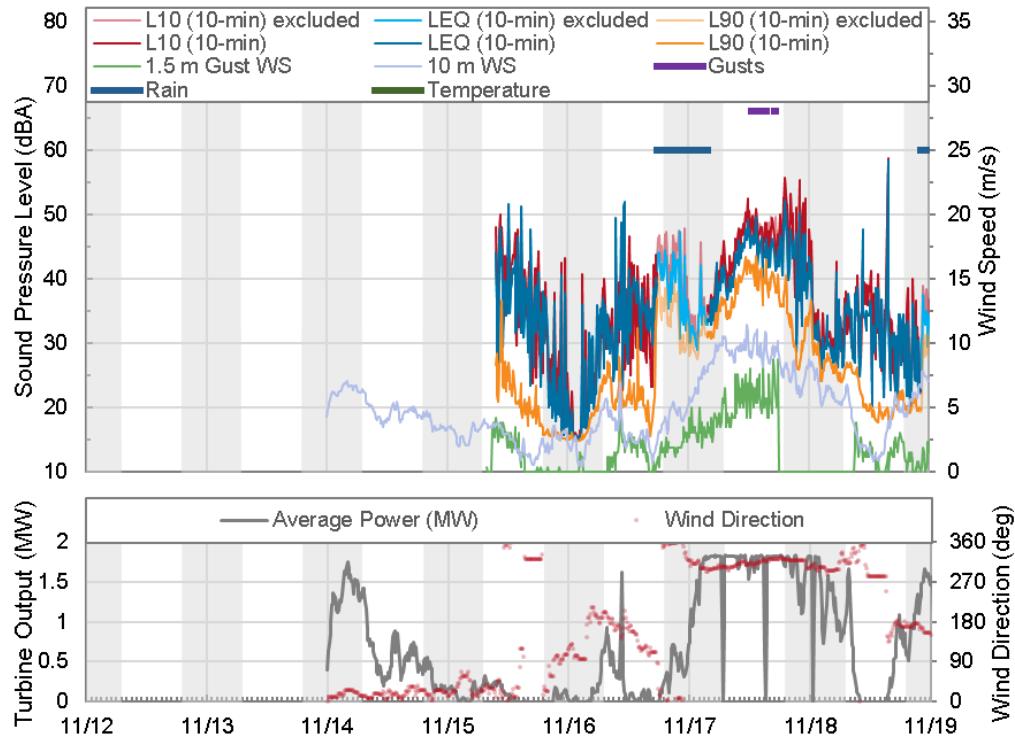

FIGURE 19: AMP-3 SOUND LEVEL TIME-HISTORY - WEEK 1

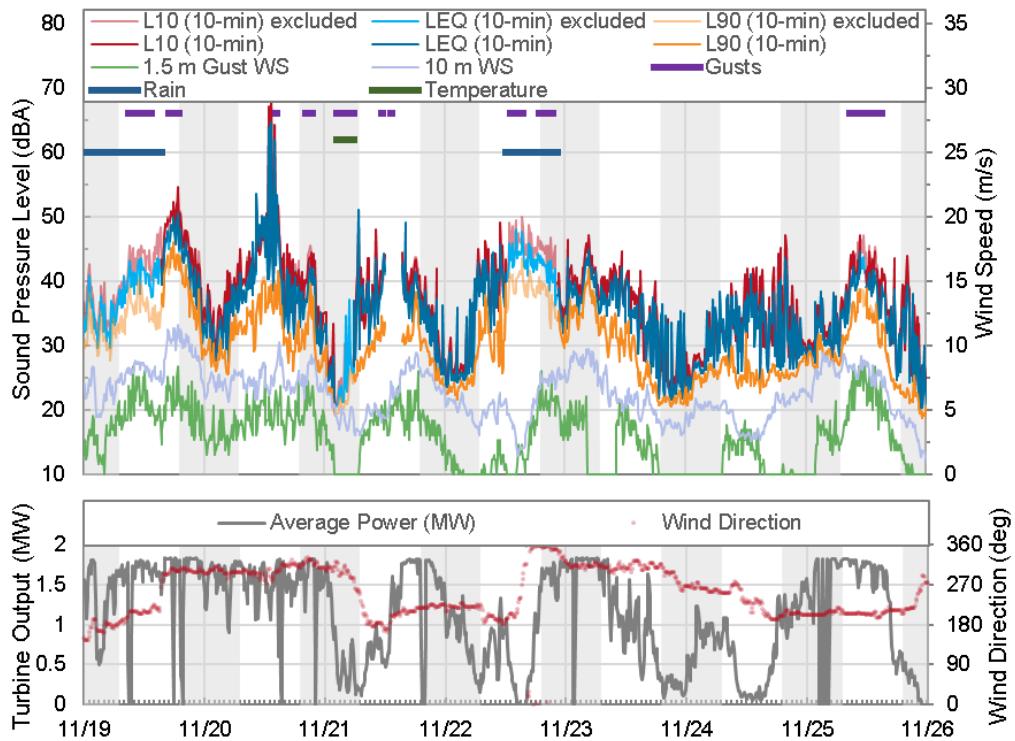

FIGURE 20: AMP-3 SOUND LEVEL TIME HISTORY - WEEK 2

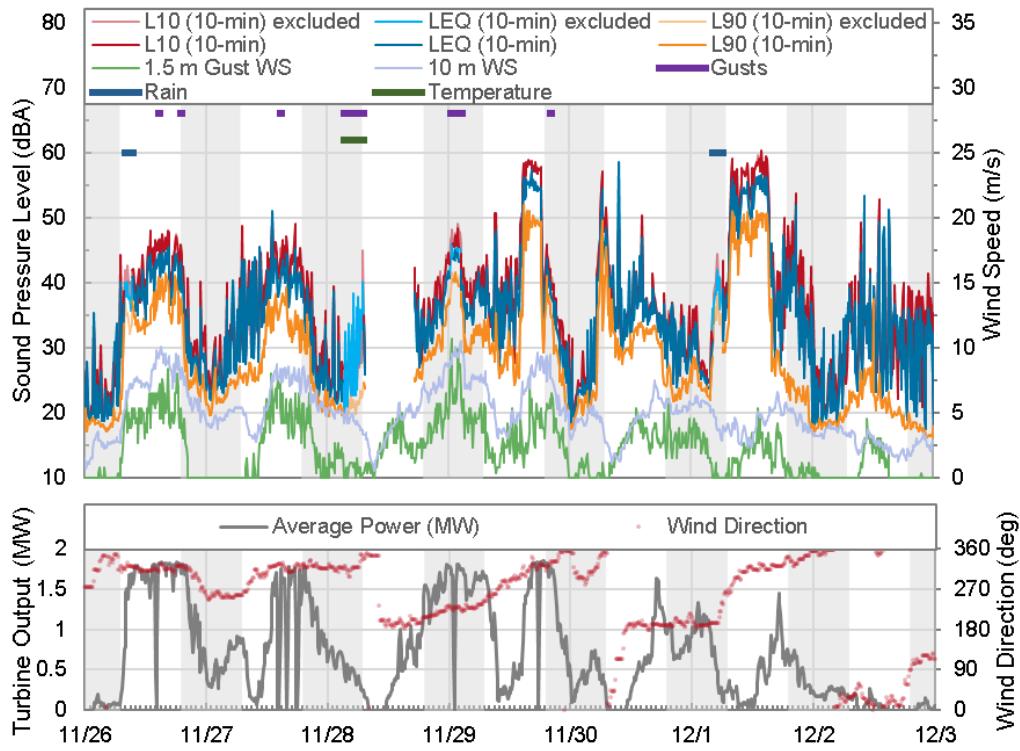

FIGURE 21: AMP-3 SOUND LEVEL TIME-HISTORY – WEEK 3

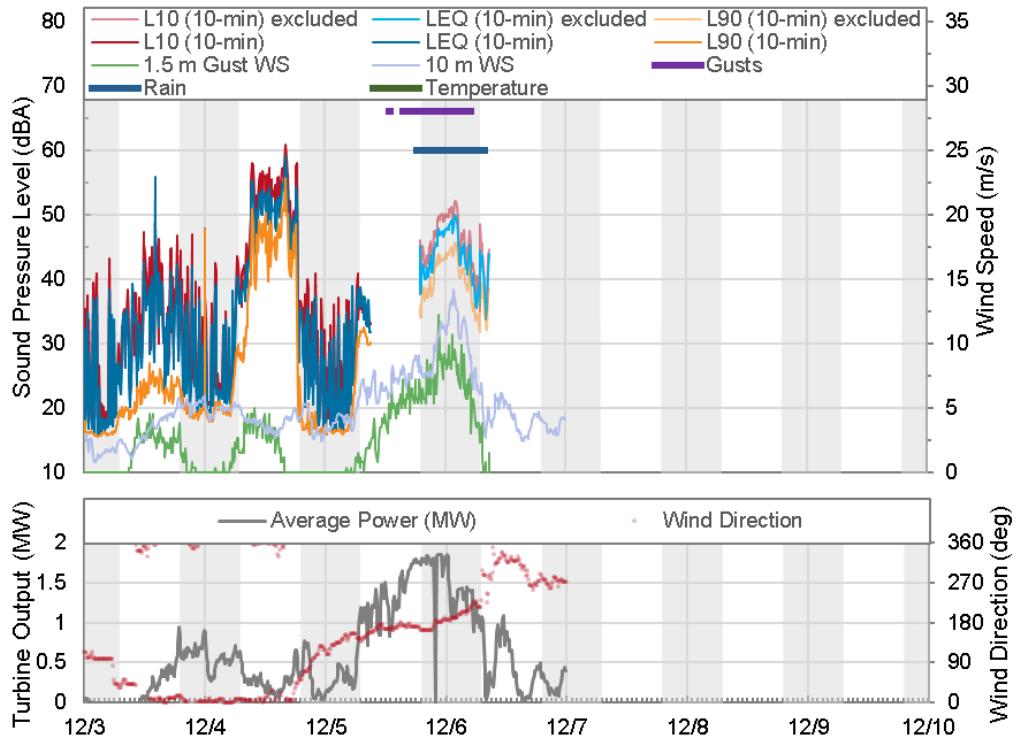

FIGURE 22: AMP-3 SOUND LEVEL TIME-HISTORY - WEEK 4

AMP-5 Results

Time-history graphics for AMP-5 are shown in Figures 23 through 26. Each figure provides the equivalent sound level (L_{EQ}), 10th-percentile sound level (L_{90}), and 90th-percentile sound level (L_{10}) in 10-minute increments. Also provided are the wind seed at microphone height, the wind speed at a 10-meter height, wind direction, and the average power output of the Pisgah Mountain turbines. Periods where data was excluded due to high wind gusts, rain, and low temperatures (below 14°F) are also shown in the graphs.

Anthropogenic sound sources include car pass-bys and airplane over-flights. Even though Bangor Water Works Road is close to the monitor, it is closed to the public, so many of the audible car pass-bys were distant, probably from Maine Route 9. Biogenic and geophonic sound sources include wind in the trees, some animals, and birds. Most sound level spikes are due to cars or airplanes. Wind turbine noise at this site was rarely audible.

Of all sites, this is the quietest, and though there are anthropogenic sounds, they are infrequent. Low elevation contributes to lower wind speeds than some sites, though the dense tree canopy produces substantial wind-caused sound during higher-wind periods. Audible wildlife activity is highest at this site, partially due to low overall sound levels. Wind-caused sound is the primary source of sound level variation.

The monitoring results including A-weighted and C-weighted values are also provided in tabular format in Appendix B.

5.0 SOUND PROPAGATION MODELING

5.1 PROCEDURES

Modeling for this project was in accordance with the standard ISO 9613-2, “Acoustics – Attenuation of sound during propagation outdoors, Part 2: General Method of Calculation.” The ISO standard states,

This part of ISO 9613 specifies an engineering method for calculating the attenuation of sound during propagation outdoors in order to predict the levels of environmental noise at a distance from a variety of sources. The method predicts the equivalent continuous A-weighted sound pressure level ... under meteorological conditions favorable to propagation from sources of known sound emissions. These conditions are for downwind propagation ... or, equivalently, propagation under a well-developed moderate ground-based temperature inversion, such as commonly occurs at night.

The model takes into account source sound power levels, surface reflection and absorption, atmospheric absorption, geometric divergence, meteorological conditions, walls, barriers, berms, and terrain. ISO 9613-2 also assumes downwind sound propagation between every source and every receptor, consequently, all wind directions, including the prevailing wind directions, are taken into account.

Model input parameters are listed in Appendix C. For this analysis we used a ground absorption factor of G=0 (hard ground) and the maximum overall sound power was modeled for each turbine type.

The acoustical modeling software used here was CadnaA, from Datakustik GmbH. CadnaA is a widely accepted acoustical propagation modeling tool, used by many noise control professionals in the United States and internationally.

Over 140 discrete receivers placed at sensitive receptors (i.e. residences) within 3.2 kilometers (2 miles) of the project were modeled at a height of 4 meters (13 feet) above ground level. In addition, a grid of receivers spaced 40 meters by 40 meters was setup at a height of 1.5 meters (13 feet) above ground, covering approximately 80 sq. km. (31 sq. mi.) around the project area.

The model included the sound emissions from both the proposed Silver Maple turbines and the Pisgah Mountain turbines. Two configuration scenarios were modeled. The first scenario included Silver Maple turbines at a hub height of 105 meters, and the second included Silver Maple turbines at a hub height of 117 meters.

5.2 RESULTS

A summary of the results for each model run is provided in Table 3, and the results for each modeled discrete receptor is provided in tabular format in Appendix D. For both model runs, all receptors are 35 dBA or less within 100 feet of the receptor.

TABLE 3: SUMMARY OF MODEL RESULTS ACROSS ALL RECEPTORS FOR EACH MODEL RUN

MODEL RUN	A-WEIGHTED RESULTS (dBA)			C-WEIGHTED RESULTS (dBc)		
	Average	Maximum	Minimum	Average	Maximum	Minimum
Silver Maple Wind at 105 m hub height with Pisgah Mountain Wind	29	35	20	46	51	37
Silver Maple Wind at 117 m hub height with Pisgah Mountain Wind	29	35	20	46	51	37

Figure 27 provides an isoline map of the modeled sound level for the 105-meter hub height model run, and Figure 28 shows the isoline map for the 117-meter hub height. The maps also show the project boundary based on project parcels and participating parcels. The modeled sound levels all along the project boundary are 45 dBA or less. Maps showing C-weighted sound levels are provided in Appendix E.

The model also calculated the projected sound level at each background monitoring location described in Section 4.2. The projected cumulative sound level from Silver Maple Wind and Pisgah Mountain Wind at each monitor location is provided in Table 4.

TABLE 4: MODEL RESULTS AT THE BACKGROUND SOUND MONITOR LOCATIONS

Location	Modeled Sound Level	
	A-weighted	C-weighted
AMP-1	35 dBA	51 dBc
AMP-2	37 dBA	53 dBc
AMP-3	35 dBA	51 dBc
AMP-5	28 dBA	44 dBc

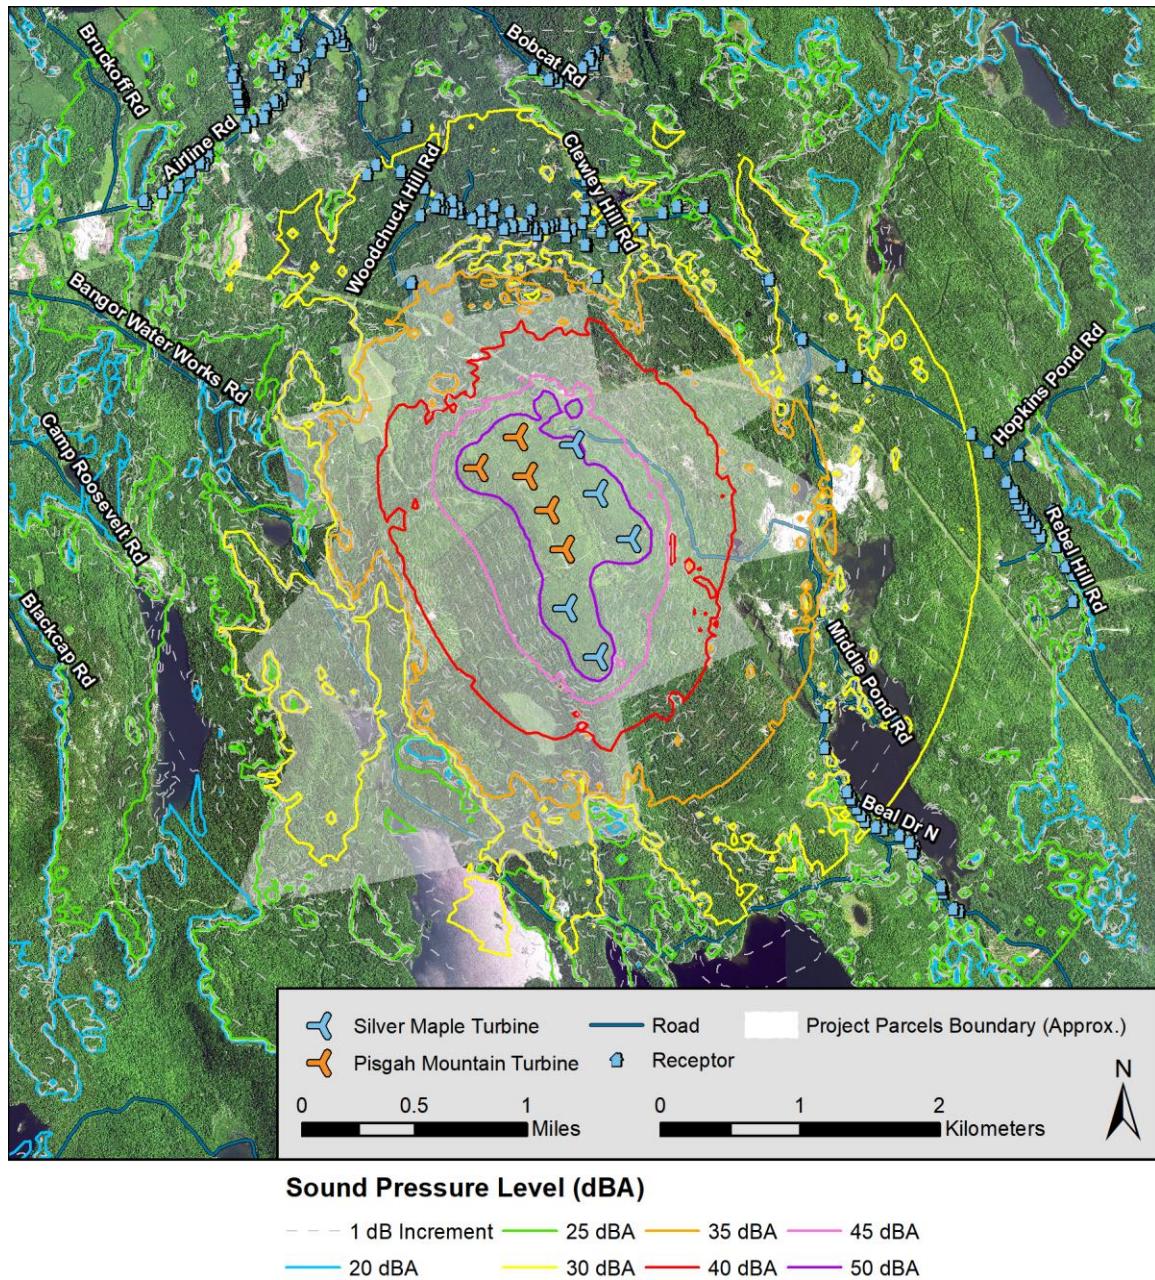

FIGURE 27: MAP OF MODEL RESULTS, SILVER MAPLE 105-METER HUB HEIGHT

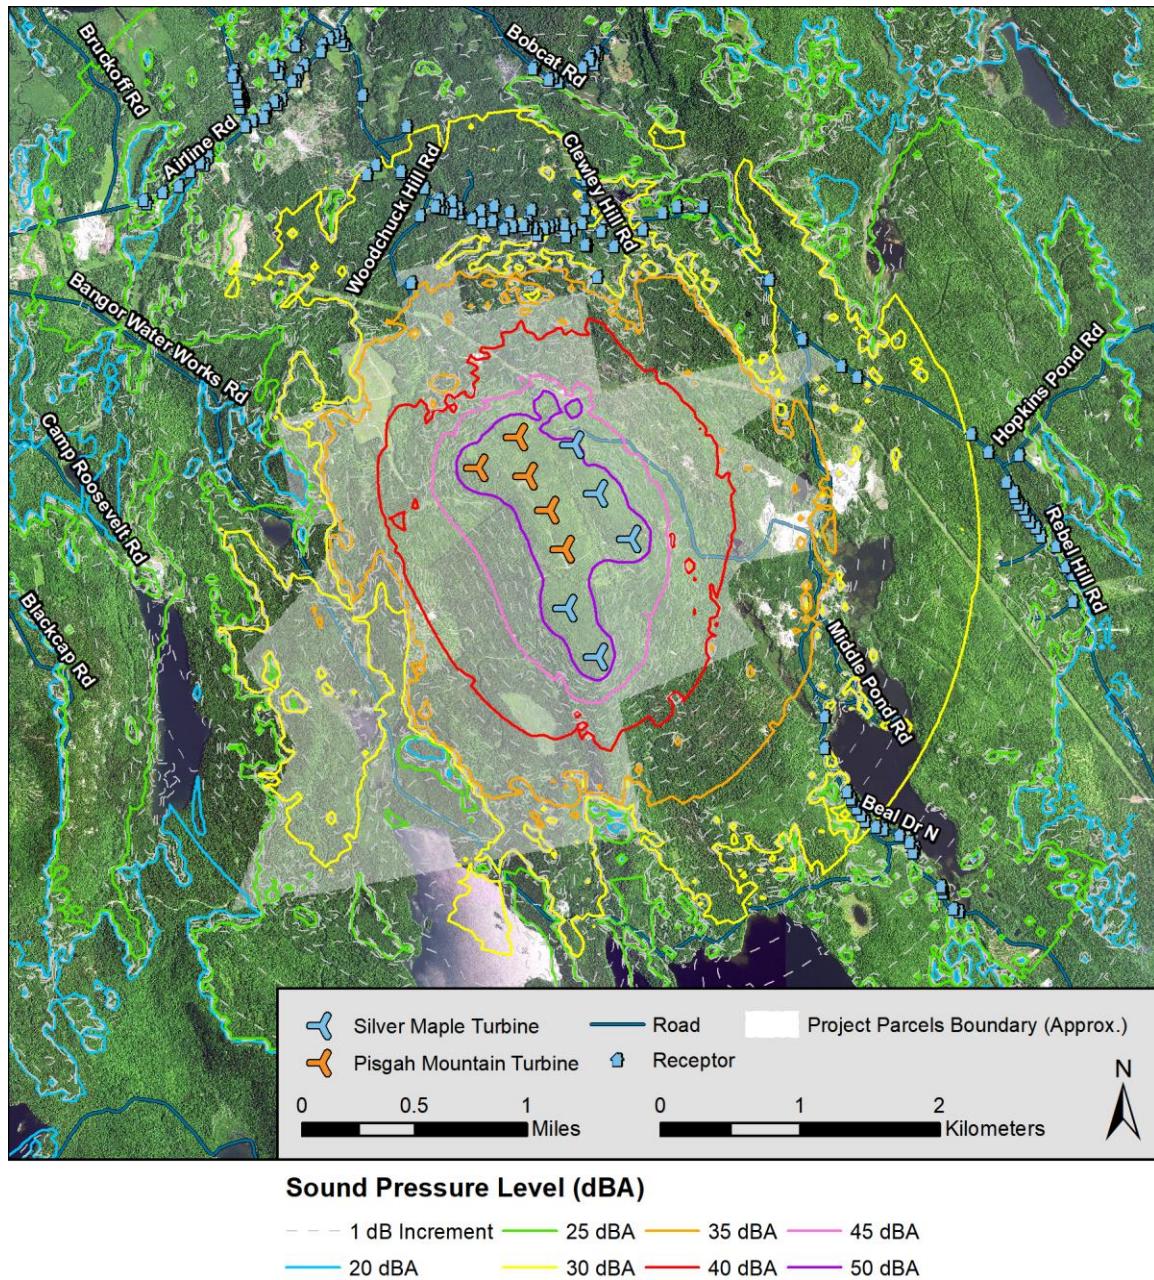

FIGURE 28: MAP OF MODEL RESULTS, SILVER MAPLE 117-METER HUB HEIGHT

5.3 MITIGATION

Silver Maple Wind is implementing mitigation features to reduce potential noise impact. The first planned mitigation measure is to use the Serrated Trailing Edge (STE) option on the Vestas V136. STE provides a reduction in noise over the standard airfoil design.

The second planned mitigation measure is to use Noise Reduced Operations (NRO) on Turbine 1, the northern-most Silver Maple turbine, under certain wind conditions. The closest residences are located north and northwest of the turbines. The highest projected sound level, 35 dBA, occurs at 96 Woodchuck Hill Road. In order to ensure that sound levels do not exceed 35 dBA within 100 feet of the receptor, Silver Maple Wind plans to implement NRO on Turbine 1 when hub height winds are 8 m/s or greater and out of the southeast \pm 22.5°. This will reduce sound emissions by 7 dB on Turbine 1 when the specified wind conditions exist.

6.0 SUMMARY & CONCLUSIONS

The Silver Maple Wind Project is a proposed wind power project that would be located in Clifton, Maine adjacent to the existing Pisgah Mountain Wind Project. SWEB Development is permitting five turbines with a rating of 4.0 MW each for a total project rating of 20 MW. In preparation for permitting, RSG conducted a noise impact assessment of the project that included background sound level monitoring of the existing environment in and around the project area and sound propagation modeling to predict sound levels at sensitive receptors and throughout the surrounding area due to the operation of both the Silver Maple Wind Project and the Pisgah Mountain Wind Project. Summary and conclusions are as follows:

1. Silver Maple is currently considering one turbine model with two hub height options, the Vestas V136 4.0 MW with a hub height of 105 meters or 117 meters.
2. Sound sources in the existing soundscape include geophonic sounds such as wind in the trees, biogenic sounds such as bird calls, and anthropogenic sounds including airplane overflights, distant traffic and vehicle pass-bys, forestry and quarrying operations, and wind turbines.
 - a. The average daytime background sound levels across the monitoring sites were 34 and 36 dBA (L_{Aeq}).
 - b. The average nighttime sound levels across the monitored sites were between 32 and 35 dBA (L_{Aeq}).
3. The applicable sound level limit comes from Section 14.8.6.1 of the Clifton Land Use Ordinance, limiting sound levels (average 10-minute L_{90}) to 35 dBA or less within 100 feet of a sensitive receptor and to 45 dBA or less at the project parcels boundary.
4. Sound propagation modeling was conducted in accordance with ISO 9613-2 at over 140 discrete receivers within 3.2 kilometers (2 miles) of the Silver Maple and Pisgah Mountain turbines. The modeling included sound emissions from the Silver Maple turbines, Pisgah Mountain turbines, Silver Maple substation, and Pisgah Mountain substation. Model runs were completed for both hub height options.
5. Model results are summarized in Section 5.2, and provided in tabular format in Appendix D. For both hub height options, all receptors are 35 dBA or less within 100 feet and all project parcel boundaries are 45 dBA or less.
6. The model took into account directional NRO on Silver Maple Turbine 1, discussed in Section 5.3, to ensure that sound levels within 100 feet of the receptor at 96 Woodchuck Hill Road are at 35 dBA or less.

Given the information in this report, the Silver Maple Wind Project can be constructed and operated in such a way as to comply with the noise limits in the Clifton Land Use Ordinance.

APPENDIX A. ACOUSTICS PRIMER

Expressing Sound in Decibel Levels

The varying air pressure that constitutes sound can be characterized in many different ways. The human ear is the basis for the metrics that are used in acoustics. Normal human hearing is sensitive to sound fluctuations over an enormous range of pressures, from about 20 micropascals (the “threshold of audibility”) to about 20 Pascals (the “threshold of pain”).³ This factor of one million in sound pressure difference is challenging to convey in engineering units. Instead, sound pressure is converted to sound “levels” in units of “decibels” (dB, named after Alexander Graham Bell). Once a measured sound is converted to dB, it is denoted as a level with the letter “L”.

The conversion from sound pressure in pascals to sound level in dB is a four-step process. First, the sound wave’s measured amplitude is squared, and the mean is taken. Second, a ratio is taken between the mean square sound pressure and the square of the threshold of audibility (20 micropascals). Third, using the logarithm function, the ratio is converted to factors of 10. The final result is multiplied by 10 to give the decibel level. By this decibel scale, sound levels range from 0 dB at the threshold of audibility to 120 dB at the threshold of pain.

Typical sound sources, and their sound pressure levels, are listed on the scale in Figure 29.

Human Response to Sound Levels: Apparent Loudness

For every 20 dB increase in sound level, the sound pressure increases by a *factor* of 10; the sound *level* range from 0 dB to 120 dB covers 6 factors of 10, or one million, in sound *pressure*. However, for an increase of 10 dB in sound *level* as measured by a meter, humans perceive an approximate doubling of apparent loudness: to the human ear, a sound level of 70 dB sounds about “twice as loud” as a sound level of 60 dB. Smaller changes in sound level, less than 3 dB up or down, are generally not perceptible.

³ The pascal is a measure of pressure in the metric system. In Imperial units, they are themselves very small: one pascal is only 145 millionths of a pound per square inch (psi). The sound pressure at the threshold of audibility is only 3 one-billionths of one psi: at the threshold of pain, it is about 3 one-thousandths of one psi.

FIGURE 29: A SCALE OF SOUND PRESSURE LEVELS FOR TYPICAL SOUND SOURCES

Frequency Spectrum of Sound

The “frequency” of a sound is the rate at which it fluctuates in time, expressed in Hertz (Hz), or cycles per second. Very few sounds occur at only one frequency: most sound contains energy at many different frequencies, and it can be broken down into different frequency divisions, or bands. These bands are similar to musical pitches, from low tones to high tones. The most common division is the standard octave band. An octave is the range of frequencies whose upper frequency limit is twice its lower frequency limit, exactly like an octave in music. An octave band is identified by its center frequency: each successive band’s center frequency is twice as high (one octave) as the previous band. For example, the 500 Hz octave band includes all sound whose frequencies range between 354 Hz (Hertz, or cycles per second) and 707 Hz. The next band is centered at 1,000 Hz with a range between 707 Hz and 1,414 Hz. The range of human hearing is divided into 10 standard octave bands: 31.5 Hz, 63 Hz, 125 Hz, 250 Hz, 500 Hz, 1,000 Hz, 2,000 Hz, 4,000 Hz, 8,000 Hz, and 16,000 Hz. For analyses that require finer frequency detail, each octave-band can be subdivided. A commonly used subdivision creates three smaller bands within each octave band, or so-called 1/3-octave bands.

Human Response to Frequency: Weighting of Sound Levels

The human ear is not equally sensitive to sounds of all frequencies. Sounds at some frequencies seem louder than others, despite having the same decibel level as measured by a sound level meter. In particular, human hearing is much more sensitive to medium pitches (from about 500 Hz to about 4,000 Hz) than to very low or very high pitches. For example, a tone measuring 80 dB at 500 Hz (a medium pitch) sounds quite a bit louder than a tone measuring 80 dB at 60 Hz (a very low pitch). The frequency response of normal human hearing ranges from 20 Hz to 20,000 Hz. Below 20 Hz, sound pressure fluctuations are not “heard”, but sometimes can be “felt”. This is known as “infrasound”. Likewise, above 20,000 Hz, sound can no longer be heard by humans; this is known as “ultrasound”. As humans age, they tend to lose the ability to hear higher frequencies first; many adults do not hear very well above about 16,000 Hz. Most natural and man-made sound occurs in the range from about 40 Hz to about 4,000 Hz. Some insects and birdsongs reach to about 8,000 Hz.

To adjust measured sound pressure levels so that they mimic human hearing response, sound level meters apply filters, known as “frequency weightings”, to the signals. There are several defined weighting scales, including “A”, “B”, “C”, “D”, “G”, and “Z”. The most common weighting scale used in environmental noise analysis and regulation is A-weighting. This weighting represents the sensitivity of the human ear to sounds of low to moderate level. It attenuates sounds with frequencies below 1000 Hz and above 4000 Hz; it amplifies very slightly sounds between 1000 Hz and 4000 Hz, where the human ear is particularly sensitive. The C-weighting scale is sometimes used to describe louder sounds. The B- and D- scales are seldom used. All of these frequency weighting scales are normalized to the average human hearing response at

1000 Hz: at this frequency, the filters neither attenuate nor amplify. When a reported sound level has been filtered using a frequency weighting, the letter is appended to “dB”. For example, sound with A-weighting is usually denoted “dBA”. When no filtering is applied, the level is denoted “dB” or “dBZ”. The letter is also appended as a subscript to the level indicator “L”, for example “ L_A ” for A-weighted levels.

Time Response of Sound Level Meters

Because sound levels can vary greatly from one moment to the next, the time over which sound is measured can influence the value of the levels reported. Often, sound is measured in real time, as it fluctuates. In this case, acousticians apply a so-called “time response” to the sound level meter, and this time response is often part of regulations for measuring sound. If the sound level is varying slowly, over a few seconds, “Slow” time response is applied, with a time constant of one second. If the sound level is varying quickly (for example, if brief events are mixed into the overall sound), “Fast” time response can be applied, with a time constant of one-eighth of a second.⁴ The time response setting for a sound level measurement is indicated with the subscript “S” for Slow and “F” for Fast: L_S or L_F . A sound level meter set to Fast time response will indicate higher sound levels than one set to Slow time response when brief events are mixed into the overall sound, because it can respond more quickly.

In some cases, the maximum sound level that can be generated by a source is of concern. Likewise, the minimum sound level occurring during a monitoring period may be required. To measure these, the sound level meter can be set to capture and hold the highest and lowest levels measured during a given monitoring period. This is represented by the subscript “max”, denoted as “ L_{max} ”. One can define a “max” level with Fast response $L_{F\text{max}}$ (1/8-second time constant), Slow time response $L_{S\text{max}}$ (1-second time constant), or Continuous Equivalent level over a specified time period $L_{\text{eq,max}}$.

Accounting for Changes in Sound Over Time

A sound level meter’s time response settings are useful for continuous monitoring. However, they are less useful in summarizing sound levels over longer periods. To do so, acousticians apply simple statistics to the measured sound levels, resulting in a set of defined types of sound level related to averages over time. An example is shown in Figure 30. The sound level at each instant of time is the grey trace going from left to right. Over the total time it was measured (1 hour in the figure), the sound energy spends certain fractions of time near various levels, ranging from the minimum (about 27 dB in the figure) to the maximum (about 65 dB in the figure). The simplest descriptor is the average sound level, known as the Equivalent Continuous

⁴ There is a third-time response defined by standards, the “Impulse” response. This response was defined to enable use of older, analog meters when measuring very brief sounds; it is no longer in common use.

Sound Level. Statistical levels are used to determine for what percentage of time the sound is louder than any given level. These levels are described in the following sections.

Equivalent Continuous Sound Level - L_{eq}

One straightforward, common way of describing sound levels is in terms of the Continuous Equivalent Sound Level, or L_{eq} . The L_{eq} is the average sound pressure level over a defined period of time, such as one hour or one day. L_{eq} is the most commonly used descriptor in noise standards and regulations. L_{eq} is representative of the overall sound to which a person is exposed. Because of the logarithmic calculation of decibels, L_{eq} tends to favor higher sound levels: loud and infrequent sources have a larger impact on the resulting average sound level than quieter but more frequent sounds. For example, in Figure 30, even though the sound levels spends most of the time near about 34 dBA, the L_{eq} is 41 dBA, having been “inflated” by the maximum level of 65 dBA and other occasional spikes over the course of the hour.

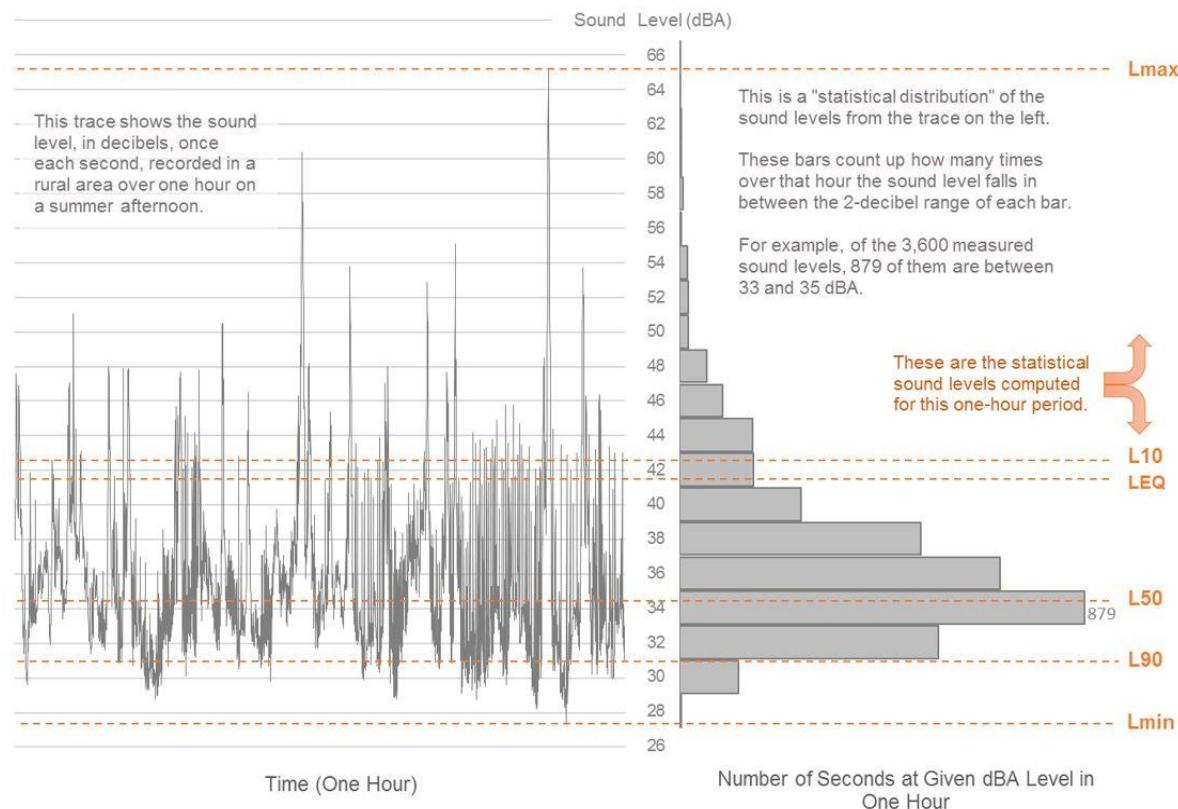

FIGURE 30: EXAMPLE OF DESCRIPTIVE TERMS OF SOUND MEASUREMENT OVER TIME

Percentile Sound Levels – L_n

Percentile sound levels describe the statistical distribution of sound levels over time. “ L_n ” is the level above which the sound spends “n” percent of the time. For example, L_{90} (sometimes called the “residual base level”) is the sound level exceeded 90% of the time: the sound is louder than L_{90} most of the time. L_{10} is the sound level that is exceeded only 10% of the time. L_{50} (the “median level”) is exceeded 50% of the time: half of the time the sound is louder than L_{50} , and half the time it is quieter than L_{50} . Note that L_{50} (median) and L_{eq} (mean) are not always the same, for reasons described in the previous section.

L_{90} is often a good representation of the “ambient sound” in an area. This is the sound that persists for longer periods, and below which the overall sound level seldom falls. It tends to filter out other short-term environmental sounds that aren’t part of the source being investigated. L_{10} represents the higher, but less frequent, sound levels. These could include such events as barking dogs, vehicles driving by and aircraft flying overhead, gusts of wind, and work operations. L_{90} represents the background sound that is present when these event sounds are excluded.

Note that if one sound source is very constant and dominates the soundscape in an area, all of the descriptive sound levels mentioned here tend toward the same value. It is when the sound is varying widely from one moment to the next that the statistical descriptors are useful.

APPENDIX B. BACKGROUND MONITOR RESULTS IN TABULAR FORMAT

This appendix provides the background sound level data for each monitor in tabular format as specified in Section 14.8.A.4.5.(iii) of the Clifton Land Use Ordinance. In the tables, nighttime is denoted by grey shading, and data that was excluded from the overall summary in Section 4.3 due to wind, rain, temperature, or anomalous events are shown in red font.

TABLE 11: MODEL PARAMETERS & SETTINGS

Parameter	Setting
Atmospheric Attenuation	Based on 10°C and 70% relative humidity
Ground Absorption	Spectral for all sources, hard ground (G=0)
Receiver Height	4 meters for residences, 1.5 meters for iso-line grid
Reflection	None
Search Distance	10,000 meters

RSG promotes sustainable business practices that minimize negative impacts on the environment. We print all proposals and reports on recycled paper that utilizes a minimum of 30% post-consumer waste. RSG also encourages recycling of printed materials (including this document) whenever practicable.

For more information on RSG's sustainability practices, please visit www.rsginc.com.
